Washington, D.C. 20548

Re: Request for analyses by the Commission's Office of Economic Analysis on Regulation SHO and failures to deliver

Dear Ms. Tremba,

This is in response to a request by Stephanie Jonkman for analyses conducted by the Commission's Office of Economic Analysis (OEA) that are relevant for the U.S. Government Accountability Office's (GAO) review of the implementation of the Commission's Regulation SHO. The enclosed CD contains the requested documents. Included on this CD are analyses regarding the effect of Regulation SHO on failures to deliver, various memos and analyses seeking to understand the economics of failures to deliver, and various spreadsheets and other documents prepared by OEA for the Commission's Office of Compliance Inspections and Examination and the Commission's Division of Enforcement.

The Commission's inspection report that you are provided with is nonpublic and confidential. We understand that, absent extraordinary circumstance, it is not the practice of the Government Accountability Office to make public disclosure of nonpublic information without prior consultation with the Commission. We request that you follow this practice in this instance, and appreciate your concern for the confidential nature of this information.

Should you have any questions or wish to set up a meeting, please contact me at 202-551-6663.

Sincerely,

Amy K. Edwards
Financial Economist

Short Selling in Initial Public Offerings

Abstract

A number of academic papers have used short sale constraints in the immediate aftermarket of IPOs to explain short-term pricing anomalies that are subsequently reversed in the long-term. Using newly available data, this paper documents that short selling is prevalent early in the aftermarket trading of IPOs. Greater short selling is observed in IPOs with positive changes in offer price, high initial returns and large trading volume. Although large levels of underpricing may be indicative of overvaluation, we find that short selling does not appear to limit *observed* underpricing. This finding is inconsistent with theoretical models that predict high initial returns, in part, by assuming constraints on short sales. Using data on failures to deliver, we test whether short sellers appear to avoid the perceived restrictions of the equity lending market by "naked" short selling. The level of failures to deliver, however, are uncorrelated with the amount of short selling and are more likely to occur in IPOs that are hypothesized to be price supported. Thus, we conclude that short selling in IPOs is neither as constrained as suggested by the literature nor the result of "naked" short sales.

Short Selling in Initial Public Offerings

1. Introduction

One of the longstanding puzzles in finance has been the pricing of initial public offerings. Many papers have assumed that constraints on short selling, immediately following an IPO, contribute to pricing inefficiencies in the short-term (Hanley, Lee, and Seguin (1996), Houge et al (2001), Ofek and Richardson (2003), Derrien (2006), and Ljungqvist, et al (2006)) which are subsequently reversed in the long-term (Miller (1977) and Ritter (1991)).

The assumption that short selling is difficult immediately after an IPO is based upon the perceived high cost of borrowing shares (Ljundqvist, Nanda and Singh (2006)), limits on underwriter lending shares during the first month of trading (Houge, et al (2001)), the lock-up of insider shares which restrict supply (Ofek and Richardson (2000)), and difficulties in locating shares prior to the closing of the offer. We test whether these potential constraints restrict short selling in the immediate aftermarket of IPOs by examining newly available data on actual short selling transactions.

Contrary to popular belief, we find that short selling occurs in 99.5% of the IPOs in our sample on the offer day and the majority of first day short sales occur at the open of trading. The average level of short sales on the offer day exceeds 7% of the shares offered and subsequently declines over the first month of trading. By the fifth trading day, the ratio of short selling to volume is only slightly lower than that documented by Diether, Lee, and Werner (2007a) for a large cross-section of stocks. We interpret this finding as an indication that the level of short selling in IPOs approaches an "equilibrium" level quickly.[1]

[1] While short selling is slightly below that documented by Diether, Lee, and Werner (2007a) by the fifth trading day, the level of short selling as a percentage of volume on the first trading day is lower than that reported for a typical

SEC_OEA_FCIC_000954

The literature provides two theories as to the expected effect of short sale constraints on the pricing of IPOs. First, Miller (1977) suggests that investor overoptimism combined with the inability to short sell the security leads to higher initial returns than would otherwise occur. More recently, the models of Derrien (2006) and Ljungqvist, Nanda and Singh (2006) predict that underwriters and issuing firms take advantage of investor sentiment or irrational exuberance by pricing issues above their intrinsic value. In this case, investor sentiment combined with short selling constraints leads to a higher change in offer price, greater underpricing and an aftermarket trading price that exceeds the "true" value of the security.

Second, underwriter price support in the aftermarket of IPOs may lead to predictable price declines after these activities cease (Aggarwal (2000) and Ellis, Michaely and O'Hara (2000)). It has been suggested that the ability of underwriters to economically sustain price stabilization in the near term and hence, higher than equilibrium prices, is partially related to constraints on short selling (Hanley, Lee and Seguin (1996)).

We test whether short sale constraints contribute to the observed pricing in both of these cases. Our results indicate that the magnitude of short selling on the first trading day is positively and significantly related to the change in offer price, the first day return from the offer price to the open and initial trading volume but unrelated to IPOs that are hypothesized to have underwriter price support.[2] These findings partially support models of investor sentiment or overoptimism in that short sellers appear to be attracted to issues in which underpricing is greatest and the potential for overvaluation is highest. However, the ability of short sellers to

---

stock. The difference in short selling on the first trading day in an IPO, as compared to seasoned stocks, may be due to the fact that the volume on the first trading day is extremely large.

[2] We cannot tell whether this result is due to a lack of demand to sell short price supported IPOs or to greater short sale constraints. Geczy, Musto, and Reed (2002) document that "dog" or cold IPOs tend to have higher rebate rates which suggests that short sale constraints might be responsible for our low observed level of short selling in this subset of IPOs.

SEC_OEA_FCIC_000955

limit *observed* underpricing is inconsistent with models of investor sentiment that predict high initial returns, in part, by constraints on short selling.[3]

We further examine whether the assumption regarding the supposed difficulties in locating or borrowing shares is valid by testing the hypothesis that short sellers are engaging in "naked" short selling activities. According to the SEC web site, "a "naked" short sale is a short sale where the seller does not borrow or arrange to borrow the securities in time to make delivery to the buyer within the standard three-day settlement period [and, as] a result, the short seller fails to deliver securities to the buyer when settlement is due (known as a "failure to deliver" or "fail to deliver")."[4] Failures to deliver, in practice, are often used as a measure for the presence "naked" short selling.[5] Using a unique database, we examine whether short sales immediately following the IPO are positively correlated with failures to deliver. To our knowledge, we are the first paper to examine the relationship between short selling and failures to deliver.

Like short selling, we find that failures to deliver are prevalent early in the aftermarket trading of IPOs. Approximately 61% of the IPOs in our sample have failures to deliver of at least 10,000 shares on *the first* standard settlement day.[6] In fact, almost 1/3 of IPOs have enough fails to deliver over the first five standard settlement days to qualify for the Regulation SHO

[3]It could obviously be the case that the level of initial return in these offers might have been higher if fewer short sales were able to be executed.
[4] http://www.sec.gov/spotlight/keyregshoissues.htm
[5] The Commission has stated that fails to deliver can be indicative of abusive or manipulative naked short selling and can deprive shareholders of the benefits of ownership, such as voting and lending, See page 8 of the release proposing to amend Regulation SHO (SEC Release No. 34-54154, July 14, 2006).
[6] The first settlement date refers to three days after the issue starts trading in the stock market. This is also the first day that a failure to deliver can occur.

SEC_OEA_FCIC_000956

threshold list on the first possible date and almost 40% appear on the list within the first month of trading.[7]

Contrary to the hypothesis that failures to deliver in IPOs are due to "naked" short selling, we find that high levels of fails to deliver are not associated with high levels of short selling. There is no evidence that short sellers are systematically engaging in "naked" short selling in IPOs.

We do show, however, that failures to deliver are more likely to occur in IPOs that are hypothesized to be price supported. This suggests that failures to deliver in price supported IPOs may arise from the mechanics of the offering process. Underwriters generally allocate more shares in an IPO than are offered (e.g., Hanley, Lee and Seguin (1996) and Aggarwal (2000)). If the initial return is positive, the underwriter covers this overallocation by exercising the overallotment option. In the case of IPOs needing price support, the underwriter will purchase shares in the open market to cover the overallocation. Unless all overallocated shares are purchased in the market on the first trading day, these overallocated shares could result in fails to deliver if investors sell them before the underwriter can purchase the shares. Therefore, underwriter price support activities could result in failures to deliver in the short-term.[8]

We also examine the impact of borrowing costs on the level of short selling and find that loan fees on T+3 are increasing in the level of short selling on T+0. This finding calls into

---

[7] When a stock has a fail to deliver level of at least 10,000 shares and 0.5% of the shares outstanding for five consecutive settlement days, the trading venue listing the stock is required to place is on a list known as the Regulation SHO threshold list.

[8] The creation of an uncovered short position by underwriters in connection with an offering is a permissible activity that facilitates an offering and is different from the delivery obligations relating to "uncovered short selling" of securities that is discussed in the Regulation SHO adopting release (SEC Release No. 34-50103, July 28, 2004 and 69 FR 48008, August 6, 2004). These are two distinctly different activities. Underwriters cover the overallocation either through the exercise of the overallotment option or through open market purchases (also known as "syndicate short covering"). Syndicate short covering, which is defined in Regulation M as "the placing of any bid or the effecting of any purchase on behalf of the sole distributor or the underwriting syndicate or group to reduce a short position created in connection with the offering," is regulated by Rule 104 of Regulation M, which governs certain aftermarket activities in connection with an offering. The Commission has proposed amendments to Rule 104 of Regulation M (see SEC Release No.33-8511, December 9, 2004).

SEC_OEA_FCIC_000957

question the interpretation of prior studies that the higher cost of borrowing for IPOs, relative to other stocks, is an impediment to short selling.

Finally, we test whether short selling is related to subsequent returns over the first trading day and the first three months after the IPO. We find no relation in the near term but cumulative short selling over the first month shows a weak negative relation to the cumulative return over the second and third months of trading. When loan fees are taken into consideration, first day short selling is significantly related to returns over the first three months. We interpret these results as an indication that short sellers in IPOs may be informed about subsequent price movements.

Overall these findings call into question prior studies' interpretations on the role of short sale constraints in the pricing of IPOs. Recent evidence by Geczy, Musto and Reed (2002), on rebate rates, suggests that IPO shares are available for borrowing as soon as the first settlement day but that access to these shares may be limited to only some investors. Even though they find that most IPOs are on special and thus, are expensive to borrow, we find that short sellers are active in IPOs. We interpret these results as evidence that short selling is not as constrained in IPOs as the literature has suggested and implies that factors other than short sale constraints may be responsible for the observed high level of initial returns in IPOs. [9]

The paper is organized as follows: A brief literature review is presented in Section 2, section 3 describes the data and summary statistics, Section 4 examines the determinants of short selling, Section 5 investigates potential "naked" short selling, and Section 6 investigates the cost of

[9] We note that our tests are unable to determine whether all demand for short selling is fully satisfied. However, many of the papers referenced above assume that short selling is impossible during the first few trading days and our results indicate that this claim is untrue.

SEC_OEA_FCIC_000958

borrowing shares and subsequent price movements. Section 7 provides a summary of the results and the conclusions.

2. Impact of Short Sale Constraints on IPO Pricing

Several theoretical papers have suggested that overoptimism by investors, coupled with short sale constraints, is a potential explanation of for the well-documented underpricing and subsequent overvaluation of IPOs (Miller (1977), Derrien (2005), and Ljungqvist, Nanda, and Singh (2006)).[10] Miller (1977) argues that if underwriters price issues according to their own assessments of the "true" value of the security, then the offer price "will be below the appraisals of the most optimistic investors who actually constitute the market for the security." Derrien (2005) and Ljungqvist, Nanda and Singh (2006) extend this argument to a theoretical framework and assume that IPOs cannot be sold short in the secondary market. By disallowing short sales, investor optimism drives the market price of IPOs far above the true value resulting in overvaluation in the secondary market

Several papers find evidence consistent with this argument. Houge, Loughran, Suchanek and Yan (2001) present evidence that measures of divergence of opinion have predictive power in explaining poor long-run returns. They argue that regulatory rules place constraints on short sales. When examining carve-out IPOs, Lamont and Thaler (2003) find evidence of mispricing between the value of the 3Com and Palm and they argue that "the demand for certain shares by irrational investors is too large relative to the ability of the market to supply these shares via short sales, creating a price that is too high." They argue that "the short sale market works sluggishly." However, they find there is substantial short interest in carve-outs in the first month

[10] In this paper we will assume that divergence of opinion, investor sentiment and overoptimism generally refer to the same general phenomenon.

SEC_OEA_FCIC_000959

after the IPO. Mitchell, Pulvino, and Stafford (2002) provide additional evidence that carve-outs are overpriced due to short sale constraints, but introduce the risk of upward price movements as a significant impediment to the profitability of short sales. Finally, Ofek and Richardson (2003) contend that short sale constraints after the IPO are responsible for the Internet bubble. They argue that only upon lockup expiration did sufficient shares become available for shorting.

More recently a number of papers question the short sale constraint argument. Dorn (2007), Ausseness, Pichler, and Stomper (2003) and Cornelli, Goldreich and Ljungqvist (2006) examine pre-IPO markets that allow short selling and still find evidence of investor overoptimism in the trading of IPOs.[11]

More direct evidence on the costs of short selling is presented by D'Avolio (2002) and Geczy, Musto and Reed (2002). [12] In particular, Geczy, et. al.'s results indicate that although IPOs are initially more expensive to short in the first month of trading, the overall cost of shorting is fairly small at around 3% at issuance and this value declines to approximately 1.5% per year. They also conclude, contrary to Ofek and Richardson (2003), that the cost of short selling around lock-ups does not appear to be an impediment. Their evidence is the first to suggest that short selling may be available earlier in the IPO process than previously thought.

The literature remains inconclusive on the presence or impact of short selling on the pricing of IPOs because the measures of short selling immediately after the IPO must be inferred by other means such as proxies for divergence of opinion, price support and rebate rates. Further, data on short interest is often not available close to the IPO offer date and such data cannot shed

[11]Grey market trading involves some sort of short position (usually by an institution) that is sold to investors (usually retail). Short sales are covered by allocations in the IPO.
[12] D'Avolio defines a stock as an IPO if it went public within the last year.

SEC_OEA_FCIC_000960

light on how quickly short sellers enter the market. Thus, it is only recently that we are able to ascertain whether theories regarding the pricing of IPOs are correct in their assumption of the lack of short selling and, by inference, whether such constraints are a plausible explanation for underpricing.

3. Data and Summary Statistics

a. *IPO Sample*

The sample of IPOs and their offering characteristics is from Securities Data Corp. (SDC) from January 1, 2005 through December 31, 2006. The sample period, beginning January 2005, is chosen because it begins after the implementation of Regulation SHO and is associated with the public release of the Regulation SHO Pilot data which contains short selling transaction information. In order for an IPO to be included in the final sample, we require that the IPO have at least 30 consecutive days of trading on CRSP, have preliminary offer prices in SDC and no prior trading history.[13] After excluding closed-end funds, the final number of IPOs in the sample is 388.[14]

Table 1, Panel A presents initial statistics on the IPO sample. On average, the mean offer amount is $188 million. The sample has a negative change in offer price of -4.18% indicating a relatively conservative IPO market. The change in offer price is defined as the percent difference between the offer price and the mid-point of the original preliminary offer price filing

[13]CRSP®, Center for Research in Security Prices. Graduate School of Business, The University of Chicago. Used with permission. All rights reserved. crsp.chicago.edu

[14] We did remove one IPO with an excessively high level of both short selling and failures to deliver, because it appears to be an outlier. This IPO had twice the level of short selling and fails to deliver as the next highest IPO. The inclusion of this one outlier affects the results.

SEC_OEA_FCIC_000961

range noted in SDC (Hanley (1993)). Approximately 39% of IPOs have offer prices above the midpoint of the preliminary offer price range and 48% have offer prices below the midpoint.

Panel B of Table 1 presents summary statistics on the first day return and trading volume. Like Aggarwal and Conroy (2000), most of the first day return occurs at the open. The mean first day return is 9.07% and the time period covered by this study is characterized by relatively "normal" levels of average first day returns.[15] Trading volume on the offer date is over 50% of the shares offered (similar to that found in Ellis, et al (2000) and Corwin, et al (2004)) which is much greater than the average trading volume on a given day for an individual stock.

b. Short Selling

In order to examine whether short selling is present in the immediate aftermarket of trading in IPOs, we collect information on transactions involving short sales for the first month of trading from the Regulation SHO pilot data. The data is compiled from nine markets: Amex, Arca Exchange, Boston Stock Exchange, Chicago Stock Exchange, NASD, NASDAQ, National Stock Exchange, NYSE and Philadelphia Stock Exchange. Individual short sale transactions are then aggregated into daily short sales for each IPO.[16]

All but two IPOs in our sample have short sales on the offer day. As shown in Table 1, Panel C, short sales comprise 12% of the trading volume and over 7% of the shares offered.[17] This finding clearly indicates that short sales are both non-trivial and are an integral part of the IPO price process on the first trading day.

---

[15] For comparison statistics, see Jay Ritter's website at http://bear.cba.ufl.edu/ritter/IPOs2005Factoids%20(2).pdf

[16] The short selling data used in this paper does not include any short selling by the underwriter (syndicate) in connection with an offering.

[17] There is no adjustment to volume between NYSE and NASDAQ IPOs.

SEC_OEA_FCIC_000962

Figure 1 shows the time distribution of short sales on the offer day by trading market. Thirty six percent of the IPOs in the sample trade on the NYSE or Amex while 64% trade on the NASDAQ. In all markets, the largest amount of short selling occurs close to the open. On average, 30% of short sales in NYSE IPOs occur in the first half hour of trading and this percentage is the maximum for the day. Although NASDAQ IPOs have no short selling between 9:30 and 10:00, this lack of short sales is due to the fact that no IPOs in the sample open before 10:00 on the offer day. As shown in Figure 1, short selling for the full sample of NASDAQ IPOs, peaks between 11:00 to 11:30.

In order to determine if differences in the opening affect the pattern of short sales throughout the day, we further classify the sample of NASDAQ IPOs by opening time. When we partition the sample by opening time, we find a similar pattern for NASDAQ IPOs as for NYSE IPOs. The highest level of short selling in NASDAQ IPOs occurs during the first half hour of trading with between 34% and 44% of the day's short sales occurring in this half-hour window depending on the time of the open. Short selling in both NYSE/Amex and NASDAQ IPOs falls after the first half hour and levels out around noon with a slight increase at the end of the day. Overall, these results indicate that there appear to be few impediments to short selling early in the trading process.

Figure 2 presents short selling as a percent of shares offered, trading volume and daily returns over the first month of trading. As can be seen in the graph, the initial trading day has the highest proportion of return, volume, and short sales. Short selling occurs over the first month of trading although the levels are quite small in relation to the first few trading days. The volume of trading and daily returns exhibit similar time-series properties with a rapid decline after the IPO and a leveling off for the remainder of the first trading month.

SEC_OEA_FCIC_000963

Figure 3 presents the time-series pattern of short selling as a percent of volume over the first month of trading, by exchange. Recent studies, that also use the Regulation SHO pilot data such as Diether, Lee, and Werner (2007a), find that short sales constitute approximately 24% of the daily trading volume in NYSE-listed stocks and 31% of volume in NASDAQ-listed stocks. As shown in Figure 3, the level of short selling quickly levels off by the fifth or sixth trading day.[18] Although the magnitude of short sales as a percent of volume remains lower for NYSE IPOs (15%) and NASDAQ IPOs (25%), than that documented by Diether, Lee and Werner (2007a), it appears from Figure 3 that short selling as a percent of volume begins to approach average levels very quickly.

4. Determinants of Short Selling

The findings of the previous section indicate that short selling is prevalent early in the trading process. To better understand the implications of this result for theories on IPO pricing, this section examines alternate hypotheses regarding the types of IPOs where short selling may be greatest. As stated above, overvaluation may occur in IPOs for two possible reasons. First, investor sentiment or divergence of opinion increases the value of the IPO beyond the "true" value. In this case, over-optimism leads to large initial returns because of high demand but results in overpricing. Thus, one hypothesis (*Overoptimism Hypothesis)* is that short selling will be high in offers with greater divergence of opinion, as proxied by positive revisions in the offer price from the preliminary file range and high initial returns.[19]

---

[18] While Diether, et.al find a much higher level of short sales relative to volume than the average short sale on the first trading day reported in our study, the amount of trading volume on the offer day for IPOs is substantially larger than the average daily trading volume for an individual stock making an exact comparison difficult.

[19] Note that this hypothesis does not directly test these theories as the theories predict that short selling constraints themselves create the overvaluation.

SEC_OEA_FCIC_000964

Short sellers might also be attracted to offerings that are overpriced because of underwriter price support. Numerous papers such as Aggarwal (2000), Boehmer and Fishe (2006), and Lewellen (2006) show that underwriters engage in price support activities in the aftermarket for IPOs. Although there is some debate in the literature regarding the impact of price support activities, at least some studies have found that IPOs exhibit significant price declines by the end of the first month after underwriters cease supporting the price. (See, for example, Hanley, Lee and Seguin (1996) and Hanley, Kumar and Seguin (1993)). This price decline may attract short sellers to IPOs that are more likely to be price supported. Short sellers, knowing that the underwriter stands ready to buy shares at a potentially inflated price, will attempt to take advantage of the subsequent price decline. A second hypothesis (*Price Support Hypothesis)* is that short selling will be high in offers more likely to have underwriter price support.

Table 2 presents univariate statistics on the level of short selling by classifying the sample of IPOs into quartiles based upon the first day return. IPOs in the two lowest quartiles have low first day returns. These IPOs are more likely to have underwriter price support as the percentage of IPOs that we define as price supported (see definition below) exceeds 2/3 of the IPOs in the quartile. In contrast, IPOs in the highest two quartiles have significantly positive first day returns and are more likely to be associated with offers that have a higher potential for overoptimism.

Consistent with the overoptimism hypothesis and contrary to the hypothesis that price support attracts short sellers, the greatest amount of short selling as a percent of shares offered is in IPOs in the highest two quartiles. IPOs in the highest two quartiles have significantly greater average short selling relative to shares offered both on the offer day and over the first month of trading as compared to the lowest two quartiles. (Indeed, there are no significant differences in

SEC_OEA_FCIC_000965

the level of short selling between the two lowest quartiles.) This table indicates a dichotomy in the amount of short selling with the level of short selling increasing in positive first day returns but relatively constant in low or negative first day returns.

We further analyze the determinants of short selling using a regression analysis with short selling on the offer day as a percent of shares offered as the dependent variable Independent variables include the first day return at the open measured from the offer price to the opening price (*First Day Return from Offer Price to Open*), the change in offer price measured as the percentage difference of the offer price from the midpoint of the preliminary offer price range (*Change in Offer Price*), and first day trading volume as a percent of shares offered (*Volume $_{T+0}$/Shares Offered*). Note that both the change in offer price and the first day return at the open should be relatively unaffected by the level of short selling because they are determined before the market opens, although we concede that sell volume at the open (which may include short sales) could be informative.

Prior research in IPOs has found that trading volume and initial return are related and significantly correlated (see Aggarwal (2002) and Krigman, Shaw and Womack (1999)). Although not presented, we also find a high degree of correlation between short selling as a percent of shares offered, trading volume as a percent of shares offered and initial return. The change in offer price is not as highly correlated with the other variables but is still significantly so. Therefore, caution must be used when including all of these variables in a regression analysis as they may capture the same economic effect.

To examine whether short selling is related to price support, we include a dummy variable (*Price Supported IPO*) equal to 1 if: a) the initial return is equal to zero or b) the IPO is in the bottom quartile of the percent of the overallotment option exercised (as collected from

SEC_OEA_FCIC_000966

Bloomberg)[20] or c) in the top quartile for the percent of trades, using TAQ, executed at the offer price on the first trading day. We use a combination of the three measures because a number of IPOs may have price support even if the initial return is not zero.[21] Aggarwal (2000), Ellis et. al. (2000), and Lewellen (2006) find that underwriters exercise less of the overallotment option when they engage in price support activities in the market. In addition, we expect that IPOs that have no change in price on the offer day or greater trades at the offer price, regardless of the initial return, are more likely to have underwriter price support.

We also include two variables that control for short sale constraints. First, the percentage float (*Float)* has been used in previous literature as a measure of borrowing constraints (Ofek and Richardson (2003) and Cook, Kieschnick, and VanNess (2006)). Thus, the smaller is the public float, as measured by the ratio of shares offered to shares outstanding from CRSP, the greater are the supposed short sale constraints.

Second, regulatory constraints such as the Uptick Rule and NASDAQ Bid Test Rule (*Ability to Execute*$_{T+0}$) could also affect the level of short selling by restricting the ability to trade on the offer day (see the Pilot Report by the Office of Economic Analysis of the U.S. Securities and Exchange Commission for more information).[22] For the NASDAQ Bid Test, we measure the percentage of the trading day when the rule allows short sales to execute against the bid price. For the Uptick Rule, we add the percentage of trades on upticks during periods when the rule does not allow short sales to execute against the bid

[20] Underwriters typically have an option to purchase additional shares from the issuer following the IPO. This option is called the overallotment option or the "green shoe" option.
[21] While each of these measures are correlated, they are not perfect substitutes.
[22] "Economic analysis of the short sale price restrictions under the Regulation SHO Pilot," by the Office of Economic Analysis is available at http://www.sec.gov/news/studies/2007/regshopilot020607.pdf.

SEC_OEA_FCIC_000967

price, then it can be executed without delay and this occurs much more often for the Bid Test than for the Uptick Rule. Note, however, that a short sale can still execute even if it cannot execute against the bid. Instead, the short sale must wait for a buy order willing to pay a price at which the short sale can execute. For the Uptick Rule, this is any price greater than the previous one. Therefore, the adjustment in the calculation for the Uptick Rule helps capture the ease of short selling.

Finally, we include a dummy variable equal to one for IPOs that trade on the NASDAQ (*NASDAQ*) to control for differences in market structure. Indeed, several recent studies note a difference between the level of short selling on the NYSE or Amex and on NASDAQ (Alexander and Peterson (2006), Diether, Lee, and Werner (2007a), Diether, Lee, and Werner (2007b), and the Pilot Report by the Office of Economic Analysis of the U.S. Securities and Exchange Commission) that may be due to market structure, regulation, or selection bias.

The results of the various regression models in Table 3 support the overoptimism hypothesis but not the price support hypothesis. Both the first day return at the open and the change in offer price are positively and significantly related to short sales indicating that short selling is more prevalent in IPOs that are expected to experience significant price increases rather than price declines.[23]

Trading volume as a percent of shares offered is also positively and significantly related to the short sales as a percent of shares offered. If volume is measuring the degree of overoptimism, this result provides additional support for that hypothesis. However, greater trading volume could also signal that it is easier for short sellers to locate shares for lending. In addition, the greater the amount of short selling, the higher may be the trading volume.

[23] In order to control for skewness in the data, we conducted a number of robustness tests including winsorizing the data to the 99th and 95th percentile as well as taking logs of (1+variable). The results remain qualitatively similar.

SEC_OEA_FCIC_000968

However, adjusting volume for the level of short selling or using raw volume and raw short sales has no effect on the regression results.

Consistent with the univariate results, we find that short sales are either unrelated to or significantly lower in price supported IPOs. This provides further evidence that short sellers are either unable or unwilling to short price supported IPOs.

The coefficients on the variables that capture potential constraints on short selling, i.e. the percentage float and the ability to execute short sales, are also generally insignificant. The negative and occasionally significant coefficient on percentage float is counter to the use of this variable as a measure of short sale constraints. The result on the ability to execute short sales suggests that price test restrictions are not a significant deterrent to short selling.

Consistent with recent literature (Alexander and Peterson (2006), Diether, Lee, and Werner (2007a), and Diether, Lee, and Werner (2007b)), the coefficient on the NASDAQ dummy is highly significant and positive. This finding indicates that IPOs on non-specialist markets have higher short selling than IPOs on specialist markets. It is not clear, however, whether this is related to the structure and regulation of the market or the types of companies that choose to go public on the NYSE/Amex or NASDAQ.[24]

Collectively, our findings suggest that IPOs that are more underpriced and more likely to have overoptimism have greater short selling than other IPOs. Although Miller (1977), Derrien (2006), and Ljungqvist, Nanda and Singh (2006) argue that informed investors are precluded from taking advantage of overoptimism because of short sale constraints, our results indicate that at least some investors are able to engage in short selling. We find no evidence in support of the hypothesis that short selling occurs in IPOs that are likely price supported.

[24] Corwin and Harris (2001) examine the listing decision of IPOs.

SEC_OEA_FCIC_000969

5. Are Short Sellers in IPOs Engaged In Naked Short Selling?

The observed high level of short selling, coupled with the presumed difficulty in borrowing shares and the potentially high cost of lending (Geczy, Musto and Reed (2002)), begs the question of whether short sellers are able to avoid those constraints by engaging in naked short selling. According to the SEC web site, "a "naked" short sale is a short sale where the seller does not borrow or arrange to borrow the securities in time to make delivery to the buyer within the standard three-day settlement period [and, as] a result, the short seller fails to deliver securities to the buyer when settlement is due (known as a "failure to deliver" or "fail to deliver")."[25] Thus, failures to deliver are often used as a measure for "naked" short selling.[26]

In this section, we analyze whether IPOs with large short selling have subsequent failures to deliver. We examine failures to deliver both on the daily aggregate level and by whether the IPO has persistent delivery failures. We use data on failures to deliver sent to the SEC from the National Securities Clearing Corporation's (NSCC) Continuous Net Settlement (CNS). The NSCC reports the level of failures to deliver to the SEC and several SROs daily for stocks that

---

[25] Regulation SHO or Regulation SHO, for short, was adopted in 2004 and provides regulations, among others, that govern locating shares prior to a short sale as well as the delivery of shares. Under Rule 203 of Regulation SHO, the broker facilitating a short sale must "locate" the stock prior to the trade.[25] "Locate" refers to the requirement under Regulation SHO that a broker-dealer have reasonable grounds to believe that the security can be borrowed for delivery on the T+3 settlement date. Note that the locate requirement is not the same as actually borrowing the security. The broker may locate these shares in its own inventory, from a prime broker, or large institutional investors through a custodial bank. The broker-dealer can rely on "easy to borrow" lists for a locate if they satisfy the "reasonable grounds" standards of Regulation SHO Rule 203. Brokers may satisfy the reasonable grounds requirement if they rely on easy to borrow lists so long as those lists are less than 24 hours old, and the securities on the list are readily available such that it would be unlikely that a failure to deliver would occur. These standards are described in Section V.A. of release number 34-50103. See http://www.sec.gov/spotlight/keyregshoissues.htm for more information.

[26] See, for example, Angel (2006) and plus press articles such as "Games Short Sellers Play," by Bob Drummond, Bloomberg Markets, September 2006, and "Failed Trades" by Liz Moyer, Forbes, August 18, 2006. The media has referred to the Regulation SHO threshold list as the "naked short selling" list. Evans, Geczy, Musto, and Reed (2006) discuss some of the economics of failures to deliver.

SEC_OEA_FCIC_000970

have aggregate failures of at least 10,000 shares. The data contains the balance of fails to deliver as of a given day.[27]

a. *Level of Failures to Deliver*

Figure 4 presents daily fails to deliver as a percent of the shares offered in addition to daily short selling. Fails to deliver are shown on the graph three days earlier (N-3) than short sales to account for the standard settlement process. Note that fails to deliver, unlike short sales, represent a balance outstanding rather than new transactions. Consistent with the pattern of short sales, the initial settlement day has the highest proportion of fails to deliver with a decline over time. While some fails to deliver are resolved after the first settlement date, many appear to persist beyond the first few days.[28]

Table 4 presents statistics on aggregate fails to deliver in excess of 10,000 shares on the first settlement day (T+3). If an IPO is not in the data on the first settlement day, the number of fails to deliver is set to zero although technically the IPO may not be in the data because the level of fails is less than 10,000 shares. The average fails to deliver, relative to shares offered, is 4.23% which is lower than the average level of short sales documented in Table 1. As a percentage of short sales, fails to deliver, on average, are over 10 times greater. This average, however, may be misleading because of skewness in the ratio due to some IPOs with small short sales but large fails. However, it is interesting to note that some IPOs have fails on T+3 that far exceed their

[27] Note that the CNS data is a net failure to deliver. Therefore, the balance is not related to any individual transaction but to the net position of the clearing member. Our data is not as comprehensive as the data studied by Boni (2006) as it does not also include failures to receive, but our data does contain a much longer time series. Some data on aggregated failures to deliver are available at http://www.sec.gov/foia/docs/failsdata.htm.

[28] The average IPO takes four days for its fails to deliver to fall below 0.5% of shares outstanding (not shown), which is the cutoff for the Regulation SHO threshold list.

SEC_OEA_FCIC_000971

short selling. (The two IPOs without short sales are not included.) We find that the median fails to deliver to short sales on the first trading day is approximately 30%.

In Table 4, we further split the sample of IPOs with failures to deliver between those that have fails on the first settlement day (Panel B) and those that have fails anytime between T+4 and T+24 (Panel C). The vast majority of IPOs in our sample have fails to deliver sometime during the first 21 trading days. Two hundred and thirty-seven IPOs (61% of the sample) have fails to deliver on T+3, 134 IPOs have fails to deliver between T+4 and T+24, and 17 IPOs have no fails to deliver at any time during the first month of trading. [29]

There is a difference between the two samples with IPOs with fails to deliver on the first settlement day having a slightly lower mean initial return and a higher average fails to deliver as a percent of either the shares offered or short sales. When fails to deliver do not occur on T+3, most IPOs have fails not long after T+3 as the sample has a median fail date of T+5.

b. *Determinants of Failures to Deliver*

In this section, we further examine the relation between short selling and both transitory and persistent fails to deliver. We define an IPO as having persistent fails to deliver if the IPO is on the Regulation SHO threshold list on the first possible date (T+7).

When a stock has a fail to deliver level of at least 10,000 shares and 0.5% of the shares outstanding for five consecutive settlement days, the trading venue listing the stock is required to place it on a list known as the Regulation SHO threshold list.[30] The earliest an IPO can be on the

[29] These 17 IPOs may not show up either because they had no fails to deliver or any fails to deliver were below 10,000 shares.

[30] Once a stock is placed on the threshold list, Regulation SHO includes additional delivery requirements. For more information on Regulation SHO and the requirements described in this section, see the rules (17 CFR 242.203) and adopting release for Regulation SHO (SEC Release No. 34-50103, July 28, 2004).

SEC_OEA_FCIC_000972

list is eight days after the issue date (T+7) in order to allow three days for the first settlement and five days of high fails to deliver. Threshold list information is collected from daily Regulation SHO lists on the NYSE, Amex, and NASDAQ.

There are 113 IPOs (almost 30% of the sample) on the threshold list on the first possible date (T+7) which indicates that many IPOs have persistent fails to deliver. This seems particularly high when considering that only about 2% of NYSE, Amex, and NASDAQ stocks qualified for the threshold list per day in May 2006.[31] An additional 42 IPOs are on the threshold list sometime during the first 30 trading days. Although not shown, when an IPO is on the threshold list on day T+7, it remains on the threshold list for a median of 12 settlement days.

In Panel A, of Table 5, we regress the level of fails to deliver on T+3 on short sales using a Tobit specification to accommodate the large number of IPOs with zero fails to deliver. We include the same independent variables as in the previous short selling regressions. We hypothesize that if short selling, at the time of the IPO, is due to the failure to locate the shares or naked short selling, regressing failures to deliver on the same variables as in the short selling regressions in Table 3 should result in similar relationships.

Our results indicate that the factors that influence short selling are *not* related to fails to deliver and the coefficient on the level of shorts sales is insignificant in each regression. Contrary to popular believe, this finding suggests that fails to deliver on the first settlement date (T+3) are not related to short sales on the offer date (T+0). Further, the coefficients on initial return, change in offer price, and volume are also insignificant. [32]

---

[31] See "Fails to Deliver Pre- and Post-Regulation SHO,": http://www.sec.gov/spotlight/failstodeliver082106.pdf.

[32] An alternative explanation for fails to deliver in IPOs is the possibility that some investors, for whom brokers are unable to locate shares or who would otherwise be unable to short sell because of regulatory restrictions, cause their brokers to mark the short trades as long. There is evidence that such marking of long sales as short have occurred in follow-on equity offers. (See "SEC and NYSE settle enforcement actions against Goldman Sachs unit for its role in

SEC_OEA_FCIC_000973

In Panel B of Table 5, we test whether persistent or long-lived fails to deliver are related to the level of short selling by conducting a probit analysis using a dummy variable for whether the IPO is on the threshold list on T+7. In general, the results in Panel B are consistent with the results in Panel A. We find no evidence that the first trading day level of short sales is related to persistent failures to deliver.[33]

The most striking result of Panels A and B is that price supported IPOs are significantly more likely to have high levels of fails to deliver and to be on the threshold list. We explore how this may occur in the next section. Overall, these findings suggest that fails to deliver in IPOs are not due to short selling, in general, or naked short selling, in particular.

c. *Could Failures to Deliver Be Due to Underwriter Price Support?*

The results in Table 5 indicate that the coefficient on Price Supported IPO is significantly positive indicating that IPOs that may have underwriter price support are more likely to have failures to deliver. In this section, we give a possible explanation of how the mechanics of underwriter price support may result in failures to deliver.

Underwriters typically oversell the number of shares in the IPO (Aggarwal (2000) and Jenkinson and Jones (2007)) and must cover this overallocation either with the exercise of the overallotment option or by purchases in the open market. Generally, the underwriter will cover its shares in the open market when the market trading price is near or less than the offer price in

---

customers' illegal trading scheme" Release 2007-41). However, absent actual evidence of such conduct, our data cannot confirm this explanation. Indirectly, our evidence suggests that mismarking could potentially be related to failures to deliver in IPOs because failures to deliver are greater when short sales are more constrained by the Uptick Rule or Bid Test. It is a violation of Regulation SHO Rules 200 and 203 (17 CFR 242.200 and 242.203) for a broker to mark a short sale as a long sale, or to lend securities for delivery on a long sale or fail to deliver on a long sale unless the broker had been reasonably informed by the seller that it owns the securities and could deliver them in time for settlement.

[33] Using cumulative short sales over the first 5 days of trading does not alter the results.

SEC_OEA_FCIC_000974

order to provide price support. Aggarwal (2000) finds that underwriter purchases in the open market, in order to cover its overallocation, occur for 10 to 15 days after the IPO. Therefore, any shares that are overallocated in the offer but not covered either through the immediate exercise of the overallotment option or underwriter market purchases on T+0 cannot settle on T+3.[34] (For the purposes of this discussion, we will term the shares oversold and allocated by the underwriter but not yet delivered as "uncovered" until the underwriter transfers shares to the investor either through the exercise of the overallotment option or by buying in the open market.)

There may be investors, however, who are unaware that they were allocated uncovered shares and who may wish to sell. The sale of these uncovered shares will then result in a fail to deliver until such time that the underwriter either purchases the shares in the open market or exercises the overallotment option and subsequently transfers the shares to the investor (technically, the broker's clearing member).

Table 5 also documents that an IPO has higher fails to deliver on day T+3 if it is traded on the NYSE or Amex. This finding may also be related to price support in that underwriters on a specialist market may find it more difficult to provide price support through open market purchases. Ellis, et al (2000) documents that the lead underwriter is always a market maker for NASDAQ listed IPOs. In contrast, for NYSE/Amex IPOs, it is unlikely that the specialist and the underwriter will be affiliated (Corwin, Harris and Lipson (2004)). The underwriters' ability to act as market makers improves their ability to directly cover their overallocated position. In the case of a specialist market, frictions may exist which preclude underwriters directly

[34] T+3 is almost always the closing day for the IPO and we find that if the overallotment option is to be exercised, it is often exercised upon closing of the IPO. Our data does not directly measure the number of allocation shares that do not settle.

SEC_OEA_FCIC_000975

purchasing shares in the open market to cover the overallocation which may result in more fails to deliver in specialist markets.

6. Borrowing Costs and Return Predictability

In this section, we further analyze the nature of short selling constraints by examining whether borrowing costs are a detriment to short selling. In addition, we test whether short selling is related to subsequent price movements over the first three months of trading.

We obtain information on borrowing costs, over the first month of trading, from a dataset of rebate rates provided by an anonymous data source. A total of 260 out of 388 IPOs (67%) have rebate rate data and we cannot determine whether a missing value in the data may be due to the absence of rebate rates for all security lenders or only for our source, in particular.

A probit analysis is conducted to determine whether bias may exist in the type of stocks covered by our data. As shown in Panel A of Table 6, the differences between the IPOs that are covered by our data source and those that are not appear to be related to the level of short selling and the trading market. We are ,more likely to observe rebate rates for IPOs that have high short selling and are traded on the NYSE or Amex.

Panel B of Table 6 presents the determinants of the cost of borrowing. For the IPOs for which data is available, the daily loan rate is calculated as the annualized federal funds rate minus the rebate rate. We then calculate the weighted average daily loan rate using the number of shares lent by the data vendor.

If the expected cost of borrowing deters short sellers from entering the market on T+0, then the relationship between the level of short selling on the offer day and loan fees on T+3 should be negative. Prior studies have used the finding of Geczy, Musto and Reed (2002), that IPOs

SEC_OEA_FCIC_000976

have higher loan fees, on average, than seasoned stocks, as evidence of constraints on short selling. On the contrary, we find that higher loan fees are related to higher, not lower, levels of short selling and our results provides additional insight into the Geczy, Musto, and Reed (2002) finding that loan fees are greatest for IPOs with high initial returns. We show that the high level of short selling on the first trading day is a good predictor of the level of loan fees on T+3 and interpret these results as an indication that borrowing costs appear not to be an impediment to short selling in IPOs.

Like Geczy, Musto and Reed (2002), we do find some evidence that potential price support is related to the loan fee. Interestingly, we find a marginally significant relation between failures to deliver and loan fees even though the level of failures to deliver and short selling are unrelated.

To further examine the cost of borrowing and subsequent returns, Table 7 presents univariate statistics for IPOs without rebate rates in our data and by quartiles of the level of loan fees for all other IPOs. Although IPOs have higher loan fees than other stocks, on average, we show that the average monthly loan fee appears to be economically small at least for the three lowest quartiles.

Initial returns are increasing in the level of loan fees for all but the highest quartile. Short sales, whether on the offer day or over the first month of trading, confirm the findings of the previous table and are increasing in the level of loan fees. Cumulative short sales are almost 38% of shares offered for the highest quartile of loan fees compared to only 13% for the lowest level. Failures to deliver are also increasing in the level of the loan fee but the magnitude of the difference between the highest and lowest quartiles is small. Failures to deliver are 4.92% of shares offered in the highest quartile and 3.31% of shares offered in the lowest quartile.

SEC_OEA_FCIC_000977

A comparison of monthly loan fees and subsequent price movements over the first and third months indicates that loan fees are relatively small in comparison to returns.[35] We calculate buy-and-hold returns adjusted for the Nasdaq Composite Index over the first month and first three months of trading. All but one of the returns, even after adjusting for loan fees, is not significantly different from zero.

Finally, Table 8 provides evidence on the return predictability of short selling over the first month and the first three months of trading. Prior studies on short selling, for example, Diether, Lee and Werner (2007a), find that the level of short sales is negatively related to subsequent returns. As our dependent variable, we calculate buy-and-hold returns adjusted for the Nasdaq Composite Index over three different time periods: Panel A) the offer day intraday return from the open to the close, Panel B) the one month return from the close of the offer day to the end of the first month and Panel C) the return over the second and third months of trading. We adjust standard errors for clustering by month of the IPO.

In Panel A, we find no evidence that the level of short selling affects the intraday return on the offer day. Although short sellers are attracted to IPOs that open at a high return, the level of short selling is not related to changes in the price after trading begins. The only independent variable that is related to intraday returns is the Price Support dummy variable, which is negative as expected.

Panels B and C examine the effect of the level of short sales over a longer time horizon. The level of short selling, whether on the offer day or cumulatively over the first month of

[35] The average level of the loan fee documented here is slightly lower than Geczy, Musto and Reed (2002) but this is to be expected as our measure of loan fees is a weighted average of the loan fees over the first trading month.

SEC_OEA_FCIC_000978

trading, has no relation to returns over a one month horizon.[36] If we extend the time period to the second and third months after the IPO, we find that only cumulative short selling over the first month of trading has a weakly, significant negative relation to subsequent price changes.

Finally, in Panel D, we examine whether the level of short selling is related to three month returns after incorporating loan fees. We measure the three month return with loan fees as the buy-and-hold NASDAQ Composite index adjusted return over the first three months of trading excluding the initial return plus the loan fee (measured over the first month of trading and multiplied by three).[37] Even after the cost of borrowing is taken into account, we find that the level of short selling, on the first trading day, is negatively related to subsequent returns. Cumulative short selling has no effect. Our findings on returns in Table 6, however, cast doubt on whether the marginal short sale is highly profitable. Thus, we conclude that short sellers are unlikely candidates to substantially mitigate any overvaluation even if they are able to predict subsequent returns.

7. Summary and Conclusions

Using short sale transactions data recently made publicly available in conjunction with the Regulation SHO Pilot, we explore the nature of short selling in initial public offerings. Many academic papers have assumed that short selling is constrained early in the IPO process and that such constraints contribute to the high level of underpricing of some IPOs. In contrast, we find

[36] The one month returns is significantly and negatively related to both the level of short selling on the first trading day and cumulative short sales over the first month if clustering is not used.

[37] We are currently in the process of collecting rebates rates over the entire three month period but for the current tests we have the weighted average loan fee only over the first month of trading. We multiply the monthly loan rate by 3 as an estimate of the three month loan rate. Since the cost of borrowing is likely to be highest in the first month of trading, we believe this is a conservative estimate of the cost of borrowing.

SEC_OEA_FCIC_000979

that short selling is prevalent on the initial trading day and many short sales occur close to the open.

Tests of whether short selling is related to price support (Hanley, Kumar, Seguin (1993), Aggarwal (2002), Lewellen (2006) or to overoptimism (Miller (1977), Derrien (2006), Cornelli, Goldreich and Ljungqvist (2006) and Ljungqvist, Nanda and Singh (2006)) indicate that short selling is clustered in IPOs that have positive initial returns. This result is consistent with models of overoptimism that suggest that short sellers should attempt to take advantage of sentiment investors in overpriced IPOs but inconsistent with the assumption that they cannot do so because of binding short sale constraints.

The perceived inability of short sellers to borrow securities for settlement is one of the primary reasons cited by others for constraints on short selling in IPOs. We test whether short sellers are avoiding regulatory constraints on locating and borrowing shares for shorting (i.e. engaging in "naked" short selling) by examining whether IPOs with greater short selling are also more likely to have failures to deliver. While we document that most IPOs have failures to deliver on the first settlement date and approximately 30% of IPOs in the sample qualify for the Regulation SHO threshold list on the first possible date, our findings do not indicate that the level of short selling on the offer date is related to fails to deliver or to the qualification for the threshold list. In fact, the factors that are correlated with increased short selling are uncorrelated with fails to deliver. We argue that fails to deliver are potentially related to underwriter price support activities and present evidence that the level of failures to deliver are related to a variable indicating a high probability of underwriter price support. Thus, we conclude that the observed short selling is not due to "naked" short sales.

SEC_OEA_FCIC_000980

Finally, we present evidence that short sellers may be informed as to subsequent price declines. The greater is the short selling on the first trading day, the lower is the three month adjusted return. However, we find evidence that the short selling does not appear to be highly profitable. Therefore, short sellers are unlikely to significantly mitigate the magnitude of the underpricing.

Collectively, these results allow us to conclude that short selling constraints are not as onerous in the IPO aftermarket as assumed in the IPO literature. This leaves open the interpretation of theories of underpricing and overvaluation that suggests that overoptimism results in greater underpricing because of short sale constraints.

Our results also complement Schultz (2008), who finds no evidence that the loosening of short sale constraints around lock-ups lead to an increase in the supply of shares causing the collapse of internet stocks. Although our sample period is after the tech bubble, our results may have implications for the argument that an increase in the supply of shares from lock-up expirations lead to the collapse of the internet stock bubble (e.g., Ofek and Richardson (2003)). Our results suggest that such expirations may not affect short sale constraints as much as previously thought, because short selling is prevalent in early IPO aftermarkets long before such lock-ups expire.

Table 1
Summary Statistics on IPOs

The sample includes 388 IPOs issued between January 1, 2005 and December 31, 2006 excluding closed-end funds. Short sales are from Regulation SHO Pilot data downloaded from nine markets: Amex, Arcaex, Boston, Chicago, NASD, NASDAQ, National, NYSE and Phlx. Offer amounts, offer prices and shares offered are from SDC and exclude the exercise of the overallotment option. Percent float is the ratio of shares offered to shares outstanding from CRSP. Change in offer price is the percent difference between the final offer price and the midpoint of the preliminary offer price range in the prospectus. The percent positive (negative) change in offer price is the percent of IPOs whose final offer price exceeds (is less than) the midpoint of the offer price in the preliminary price range. The percent positive (negative) change in offer price is the percent of IPOs whose final offer price exceeds the midpoint of the offer price in the preliminary price range. The first day return is from the offer price from SDC to the first trading day closing price on CRSP Volume is the daily number of shares traded from CRSP.

Panel A: Offering Statistics		
Variable	Mean	Median
Offer Price	$14.82	$14.50
Offer Amount (in mils)	$188.53	$114.23
Percent Float	46.88%	33.52%
Change in Offer Price	-4.18%	0.00%
Percent Positive Change in Offer Price	39.43%	-
Percent Negative Change in Offer Price	47.68%	-
Panel B: Offer Day Trading Statistics		
Variable	Mean	Median
First Day Return from Offer Price to Open	9.07%	2.84%
First Day Return from Open to Close	0.62%	0.00%

Table 2
Comparison of First Day Trading and Short Selling by Quartiles of First Day Returns

The sample includes 388 IPOs issued between January 1, 2005 and December 31, 2006 excluding closed-end funds. Short sales are from Regulation SHO Pilot data downloaded from nine markets: Amex, Arcaex, Boston, Chicago, NASD, NASDAQ, National, NYSE and Phlx and are scaled by shares offered, trading volume on the offer day and shares outstanding after the offer. Offer amount and shares offered are from SDC and excludes the exercise of the overallotment option. Percent float is the ratio of shares offered to shares outstanding from CRSP. An IPO is considered Price Supported if the first day return is equal to zero or the IPO is in the bottom quartile of the percent of the overallotment option exercised collected from Bloomberg or top quartile for the percent of trades, using TAQ, executed at the offer price on the first trading day. The first day return is from the offer price from SDC to the first trading day closing price on CRSP. Change in offer price is the percent difference of the final offer price from the midpoint of the preliminary offer price range in the prospectus. The percent positive (negative) change in offer price is the percent of IPOs whose final offer price exceeds the midpoint of the offer price in the preliminary price range. Volume is the daily number of shares traded from CRSP. Medians are in parentheses.

	First Day Return			
	Lowest	Quartile 2	Quartile 3	Highest
Number of IPOs	85	109	97	97

Table 3
Regression Analysis on Offer Day Short Sales

The sample includes 388 IPOs issued between January 1, 2005 and December 31, 2006 excluding closed-end funds. The dependent variable is the offer day short sales as a percent of the offer amount. Short sales are from Regulation SHO Pilot data downloaded from nine markets: Amex, ArcaEx, Boston, Chicago, NASD, NASDAQ, National, NYSE and Phlx, aggregated and then scaled by offer amount. Shares offered are from SDC and exclude the exercise of the overallotment option. The first day return is from the offer price from SDC to the first trading day closing price on CRSP. Change in offer price is the percent difference of the final offer price from the midpoint of the preliminary offer price range in the prospectus. Volume is the daily number of shares traded from CRSP. Price Supported IPO is a dummy variable equal to 1 if the first day return is equal to zero or the IPO is in the bottom quartile of the percent of the overallotment option exercised collected from Bloomberg or top quartile for the percent of trades, using TAQ, executed at the offer price on the first trading day. Percent float is the ratio of shares offered from SDC to shares outstanding from CRSP. The ability to execute is estimated using TAQ and measures the extent to which the Uptick Rule or NASDAQ Bid Test allows short sales to execute. NASDAQ is a dummy variable equal to 1 if the IPO trades on either the NASDAQ, 0 if it trades on the NYSE or the Amex. t-values are in parentheses. ***, **, * indicates significance at the 1%, 5% or 10% levels.

Table 4
Summary Statistics on Fails to Deliver

The sample includes 388 IPOs issued between January 1, 2005 and December 31, 2006 excluding closed-end funds. Daily fails to deliver for IPOs is from NSCC's Continuous Net Settlement which includes stocks with aggregate fails to deliver of at least 10,000 shares. Short sales are from Regulation SHO Pilot data downloaded from nine markets: Amex, ArcaEx, Boston, Chicago, NASD, NASDAQ, National, NYSE and Phlx, aggregated. Shares offered are from SDC and exclude the exercise of the overallotment option. The first day return is from the offer price from SDC to the first trading day closing price on CRSP.

Panel A: All IPOs First Settlement Day (T+3)		
Variable	Mean	Median
Fails to Deliver/Shares Offered	4.23%	2.29%
Fails to Deliver/Short Sales$_{T+0}$	1,083.37%	30.32%
Panel B: 237 IPOs with First Fail on First Settlement Day (T+3)		
Variable	Mean	Median
First Day Return	9.14%	3.67%
Fails to Deliver/Shares Offered	6.92%	5.73%
Fails to Deliver/Short Sales$_{T+0}$	1,779.50%	99.70%
Panel C: 134 IPOs with First Fail Later Than First Settlement Day (T+4 to T+24)		
Variable	Mean	Median
First Day Return	10.88%	5.44%
First Fails to Deliver/Shares Offered	0.86%	0.46%
First Fails to Deliver/Short Sales$_{T+0}$	31.47%	7.99%
Day of First Fails to Deliver	6.14	5.00

SEC_OEA_FCIC_000988

Table 5
Analysis on Fails To Deliver and Probability of Being on Threshold List on T+7

The sample includes 388 IPOs issued between January 1, 2005 and December 31, 2006 excluding closed-end funds. Dependent variables are first settlement day fails as a percent of shares offered and a dummy variable if the IPO is on the threshold list on day T+7. Daily fails to deliver for IPOs is from NSCC's Continuous Net Settlement which includes stocks with aggregate fails to deliver of at least 10,000 shares. Information is collected from daily threshold lists on the NYSE, Amex, and NASDAQ. Short sales are from Regulation SHO Pilot data downloaded from nine markets: Amex, ArcaEx, Boston, Chicago, NASD, NASDAQ, National, NYSE and Phlx, aggregated and then scaled by offer amount (excluding the exercise of the overallotment option). The first day return is from the offer price from SDC to the first trading day closing price on CRSP. Change in offer price is the percent difference of the final offer price from the midpoint of the preliminary offer price range in the prospectus. Volume is the daily number of shares traded from CRSP. Price Supported IPO is a dummy variable equal to 1 if the first day return is equal to zero or the IPO is in the bottom quartile of the percent of the overallotment option exercised collected from Bloomberg or top quartile for the percent of trades, using TAQ, executed at the offer price on the first trading day. Percent float is the ratio of shares offered from SDC to shares outstanding from CRSP. The ability to execute is estimated using TAQ and measures the extent to which the Uptick Rule or NASDAQ Bid Test allows short sales to execute. NASDAQ is a dummy variable equal to 1 if the IPO trades on either the NASDAQ, 0 if it trades on the NYSE or the Amex. t-values are in parentheses for Tobit regressions and z scores for Probit analysis. ***, **, * indicates significance at the 1%, 5% or 10% levels.

Table 7
Univariate Statistics on the Cost of Borrowing

The sample includes 388 IPOs issued between January 1, 2005 and December 31, 2006 excluding closed-end funds. The weighted average loan fee (by loan amount) is equal to the rebate rate minus the fed funds rate over the first 26 days of trading and is collected from an anonymous data source. The first day return is from the offer price from SDC to the first trading day closing price on CRSP. Short sales are from Regulation SHO Pilot data downloaded from nine markets: Amex, ArcaEx, Boston, Chicago, NASD, NASDAQ, National, NYSE and Phlx, aggregated and then scaled by offer amount (excluding the exercise of the overallotment option). Daily fails to deliver for IPOs is from NSCC's Continuous Net Settlement which includes stocks with aggregate fails to deliver of at least 10,000 shares. First month and three month returns are the buy-and-hold return minus the return on the NASDAQ Composite Index. Three Month Return With Loan Fees is the NASDAQ Composite index adjusted return over the first three months of trading excluding the first day return plus the loan fee (measured over the first month of trading and multiplied by three). Price Supported IPO is a dummy variable equal to 1 if the first day return is equal to zero or the IPO is in the bottom quartile of the percent of the overallotment option exercised collected from Bloomberg or top quartile for the percent of trades, using TAQ, executed at the offer price on the first trading day. NASDAQ is a dummy variable equal to 1 if the IPO trades on the NASDAQ, 0 if it trades on the NYSE or the Amex. Information is collected from daily threshold lists on the NYSE, Amex, and NASDAQ. Medians are in parentheses. ***, **, * indicates returns/profits are significantly different from zero at the 1%, 5% or 10% levels.

SUBJECT: Additional Fails Analysis

There have been substantial decreases in a number of fails to deliver measures from the first month of Regulation SHO to the most current month of data. Table 1 examines the change in fails to deliver from January 2005[1] to September 2005. The primary results are as follows:

- The average daily aggregate fails to deliver declined by 35.2%.
- The average daily number of securities with aggregate fails of at least 10,000 shares declined by 7.7%.
- The average daily number of fails to deliver positions declined by 14.7%.
- The average age of a fail position increased by 2.7%.
- The average daily aggregate new fails to deliver declined by 18.5%.[2]
- The average daily number of new fails to deliver positions declined by 6.4%.
- The average daily number of threshold securities declined by 32.1%.[3]
- The average daily fails of threshold securities declined by 22.7%.

[1] The first threshold list became effective on January 7th. Therefore, the January 7, 2005 to January 31, 2005 period is used in this analysis.
[2] New fails are defined as fail positions with age equal to 1 day. The NSCC data only shows the oldest age position for each clearing identifier. Thus, these numbers potentially undercount new fails. However, if anything, there is less undercounting after the Rule since the number of clearing positions declined by 15% after the Rule. Thus, the bias works against finding a decline in new fails after the Rule.
[3] To be included on the threshold security list a security need to have aggregate fails to deliver of 10,000 shares or more and at least 0.5% of total shares outstanding for five consecutive settlement days. A security remains on the list until it has five consecutive settlement days with fails below this criteria.

Table 1
Summary Statistics on Fails to Deliver

Measure	January 2005[4]	September 2005	Change	Percent Change
Number of Days	16	21		
Average Daily Aggregate Fails (millions)	683.7	443.1	-240.6	-35.2%

[4] The first threshold list was published on January 7th. Therefore, the January 7, 2005 to January 31, 2005 period is used in this analysis.

INTEROFFICE MEMORANDUM

TO: MICHAEL POST

ERIK SIRRI, BOB COLBY, MARLON PAZ, JAMIE BRIGAGLIANO, JOSEPHINE TAO, AND TORY CRANE

FROM: AMY K EDWARDS

SUBJECT: ANALYSIS OF THE EFFECT OF FAILING TO DELIVER ON RETURNS

DATE: 9/21/2007

CC: JIM OVERDAHL, STEWART MAYHEW, AND TIM MCCORMICK

This memo summarizes findings from a preliminary study of the effect of failing to deliver on returns. The objective of the study is to examine whether the trades that result in an increase in fails appear to drive prices downward. The idea is that a result that fails tend to be associated with a drop in price suggests that regulations that penalize participants for fails might make manipulations more difficult and could potentially improve market efficiency. Overall, we do not find evidence that increases in fails or persistent fails are systematically associated with trades that drive prices downward.[1] Therefore, this analysis is unable to provide empirical support for arguments that failures to deliver harm pricing efficiency.

Summary of the Results:

- Trades resulting in increases in *aggregate* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.
- Trades resulting in *persistent* increases in *aggregate* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.
- Trades resulting in *transitory* increases in *aggregate* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.
- Trades resulting in *persistent* increases in *clearing member* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.

[1] A systematic negative association would imply that fails are regularly associated with trades that drive prices downward. The absence of a systematic association does not rule out isolated instances, but it does mean that these isolated instances are not significant enough to influence the overall averages.

- Trades resulting in *transitory* increases in *clearing member* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.

Sample

We started with a sample of securities for which we had return or failure to deliver information for 2006. We delete securities if we do not have price or return data for that security and we delete securities if we do not have fail to deliver data for that security.[2] This yields a sample of 7,945 securities.

Studies commonly screen out securities that are delisted before the end of the sample period or that were listed after the start of the sample period. We do not screen these observations out. Instead, we require only that the security have at least 60 days (one quarter) of trading information. Therefore, our results may be affected by IPOs, firms that did not survive the year, and/or firms that are delisted from a market such that their prices are no longer included in our data. We believe that this sample represents the universe of non-OTC stocks well.

Analysis

We examine failures to deliver and returns on each *trading day* in 2006. For a given trading day, we compare the return to the change in failures to deliver from two to three *settlement days* after the trading day. Our concern is on whether there is evidence that trading that results in an increase in fails causes downward price pressure. In this situation, an increase in fails should be preceded by negative returns three settlement days earlier. Statistically, this means that we expect fails to be negatively correlated with preceding returns. Therefore, our null and alternative hypotheses are as follows:

Null Hypothesis (H_0): trading that results in an increase in failures to deliver has no effect on prices. Statistically, this means fails are not correlated with returns three days earlier.

Alternative Hypothesis (H_{A1}): trading that results in an increase in failures to deliver depresses security prices. Statistically, this means fails are negatively correlated with returns three days earlier.

We add a second alternative hypothesis because fails could also be due to liquidity suppliers such as market makers selling during price increases.

Second Alternative Hypothesis (H_{A2}): trading that results in an increase in failures to deliver comes from liquidity provision. Statistically, this means increases in aggregate fails are positively correlated with returns three days earlier.

[2] We receive failure to deliver data from the NSCC for equity securities with failures to deliver of at least 10,000 shares on a particular date. Therefore, we cannot differentiate no fails from fails of less than 10,000 shares.

We care about whether the correlation between an increase in fails and returns is stronger for securities that are on the Regulation SHO threshold list (i.e., already have significant fails) or when the increase in fails contributes to a security qualifying for the threshold list. Therefore, we designed our tests not only to measure the correlation between an increase in fails and returns, but to also measure any differential effect on this correlation of a security's threshold status. This helps us understand whether the economic effect of failures to deliver on stock prices is any different when a security is a threshold security. We consider whether the security is on the threshold list on the same day as an increase in fails and also whether the increase in fails might contribute to the security being added to the threshold list.

With these objectives in mind, we designed the following regression equation to estimate our tests:

$$R_{it} = \alpha + \beta_1 \Delta F^{+}_{it} + \beta_2 th^{3}_{it} \Delta F^{+}_{it} + \beta_3 th^{4,8}_{it} \Delta F^{+}_{it} + \varepsilon_{it} \qquad (1)$$

where R_{it} is the return for security i from t-1 to t, ΔF^{+}_{it} is the change in failures to deliver for security i from t+2 to t+3, if the change is positive, th^{3}_{it} is a dummy variable indicating that the stock is on the threshold list on day t+3, and $th^{4,8}_{it}$ is a dummy indicating that the stock is not on the threshold list on day t+3 but is added to the list by day t+8. In this model, β_1 is negative under the hypothesis that failures to deliver depress prices. A negative β_2 would indicate that failures to deliver depress prices in threshold securities more than they do in other securities. Adding β_1 to β_2 tells us the total effect of an increase in fails on returns in a threshold security. A negative β_3 would indicate that failures to deliver depress stock prices more when they occur just prior to a security qualifying for the threshold list than at other times. Adding β_1 to β_3 tells us the total effect on returns of an increase in fails that contributes to a security qualifying for the threshold list.

There are two serious considerations when interpreting the results of this regression. The regression is designed to examine associations and not causations. Therefore, while this memo mentions "effects", these tests really only measure associations. In addition, these regression coefficients will not allow us to distinguish a negative correlation associated with systematic manipulation, which reduces pricing efficiency, from a negative correlation associated with price discovery, which is important for pricing efficiency. Therefore, if we find that increases in fails are associated with negative returns, we will need to run additional tests to examine causation and whether increases in failures to deliver improve or reduce pricing efficiency.

Results for Aggregate Fails

We first estimate the regression in equation (1) for failures to deliver aggregated by security on each date on a data set containing each security that is in our sample for at least one quarter in 2006. Table 1 shows the coefficients that result from estimating equation (1).[3] The equation is

[3] We estimate this in a pooled regression that adjusts the variance-covariance matrix for cross-sectional heteroskadasticity. This heteroskadasticity exists because of the large cross-sectional variation in fails across stocks.

estimated for failures to deliver measured in units of 10,000 shares and also for failures to deliver measured as a percentage of shares outstanding. The table also shows whether the coefficient is statistically different from zero based on a t-test.

Table 1: Results of a Pooled Regression of Returns on Aggregate Fails

$$R_{it} = \alpha + \beta_1 \Delta F_{it}^{+} + \beta_2 th_{it}^{3} \Delta F_{it}^{+} + \beta_3 th_{it}^{4,8} \Delta F_{it}^{+} + \varepsilon_{it}$$

β_1 measures the effect on returns of trading that resulted in an increase in fails. β_2 measures the difference in effect on returns when the security is on the threshold list. β_3 measures the difference in effect on returns when the increase in fails contributed to threshold qualification. The effect on returns is given in basis points. Statistical significance at the 10, 5 and 1% level is indicated by *, **, or ***.

Measurement of Fails:	In units of 10,000 shares	In units of 1% of shares outstanding
α	61.48***	61.41***
β_1	-0.09	>-0.01
β_2	-0.07	-0.01
β_3	-0.09	-0.01
$\beta_1 + \beta_2$	-0.17	-0.01
$\beta_1 + \beta_3$	-0.18	-0.01

The results for β_1 show that during 2006, each 10,000 increase in failures to deliver is associated with a 0.09 basis point decline in stock value, or each increase in failures to deliver of 1% of the shares outstanding is associated with a price decline of less than 0.01 basis points. In addition to being very small economically, neither of these results is statistically different than zero. This means that the effect on returns is unlikely to be meaningfully negative. Likewise, the results for β_2 and β_3 are also small and insignificant. Even when β_2 and β_3 are added to β_1, the effect on returns is small. Therefore, the results from Table 1 indicate that an increase in failures to deliver has no economic effect on stock prices.

Decomposing Fails

We next attempt to capture the effect of longer lived fails by separating the part of the increase in fails that is due to long-lived, or persistent, fails and short-lived, or transitory, fails. We do this by measuring how much of the increase in fails persists for five days. To see how we measured this, consider Figure 1. The increase from t-1 to t can be divided into a transitory portion (T) and a persistent portion (P) as defined by the level of fails in the five days following an increase so that the change on day t, ΔF, will be equal to T + P. The permanent portion is the part of the change in fails that appears to last at least 5 days. By contrast, the transitory portion is the portion that appears to last less than 5 days.

Note that we cannot exactly tell if any of the fails on t+1 are associated with same fails on t. Further, we assume that any decrease in fails offsets the most recent fail. Alternatively, we could have assumed that a decrease in fails offset the oldest fail. Therefore, this analysis is an approximation.

Some stocks rarely have fails and never have large fails, while others have fail levels that vary widely from day to day.

Figure 1

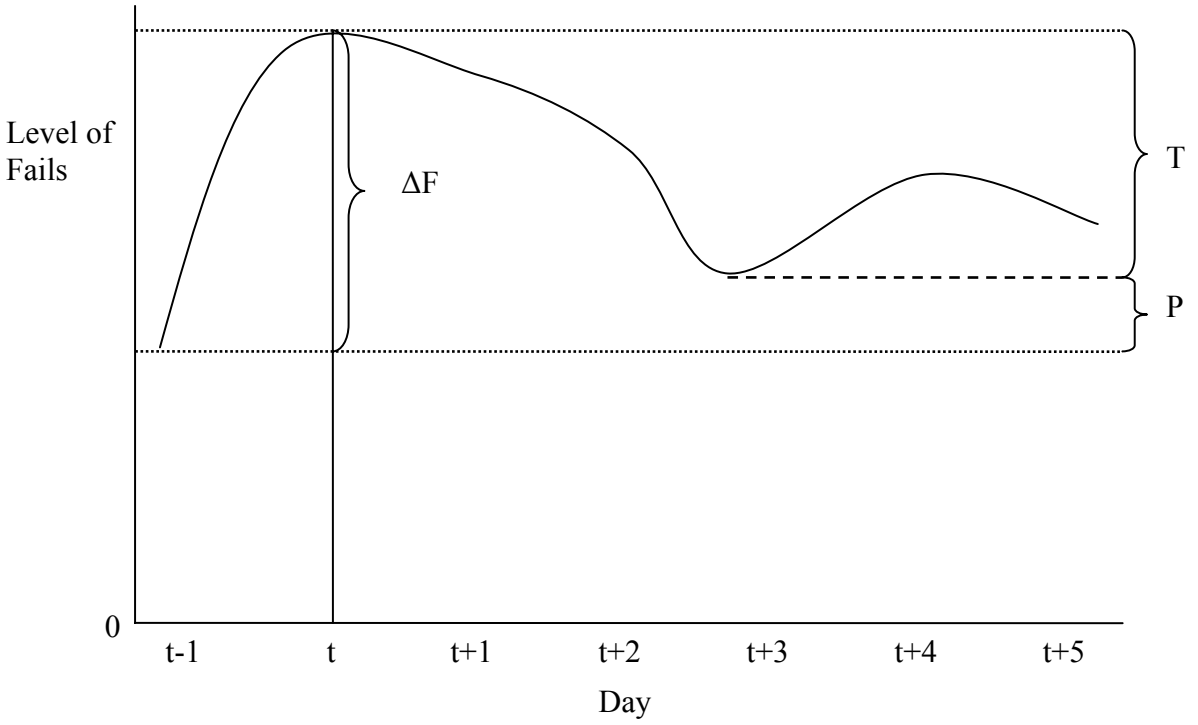

Figure 1 represents a simple case when fails decline following t but do not fall below the t-1 level. Figure 2 shows how we measure transitory and permanent fails for several other scenarios. Note that transitory fails, T, can never be less than 0 and can never be greater than the change in fails on day t, ΔF. Likewise, permanent fails, P also range only from 0 to ΔF. In figure 2a, fails increase after day t and remain above the level on day t for the next five days. In this case, all of the change from t-1 to t is considered permanent and none of the fails can be called transitory. So, P = ΔF and T = 0. By contrast, Figure 2b shows a situation in which the fails increase after day t but fall back below the day t level. As in Figure 1, we can use the lowest fail level to estimate how much of ΔF appears to be cleared within five days. The remaining portion of ΔF is called permanent. In Figures 2c and 2d, the fails level falls below the level on t-1 so none of ΔF can be called permanent. This is true whether the level stays below the level on t-1 (2c) or rises back above that level within five days (2d).

Figure 2a

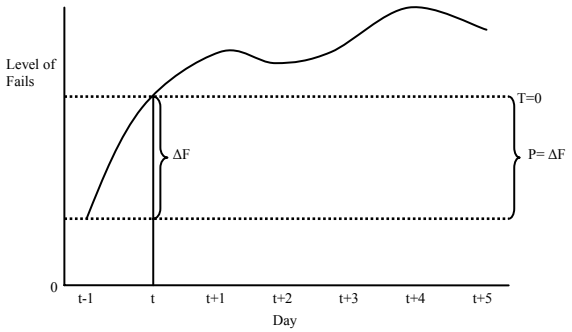

Figure 2b

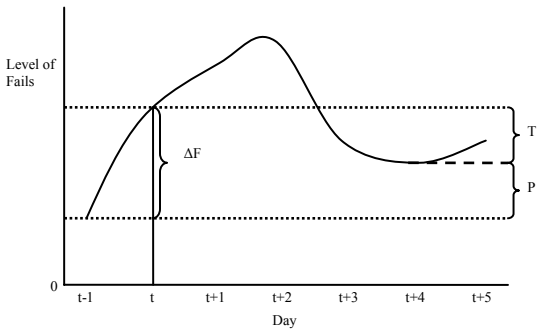

Figure 2c

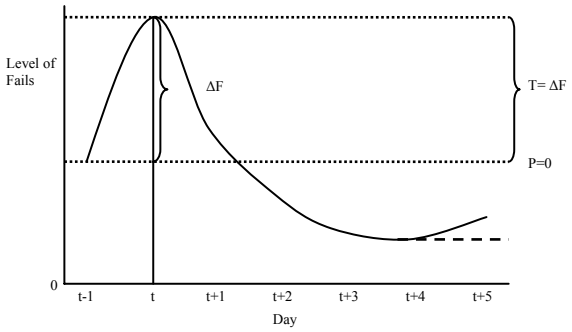

Figure 2d

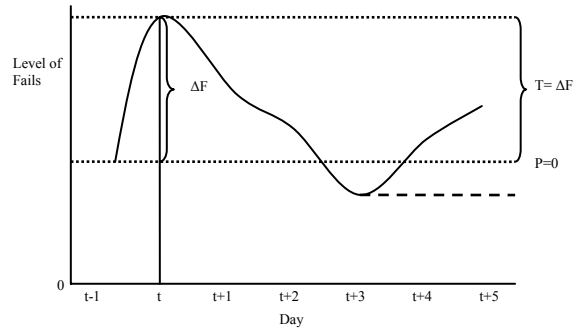

Results for Decomposed Aggregate Fails

To examine the effect of persistent and transitory fails on prices, we adjust equation (1) as follows:

$$R_{it} = \alpha + \beta_{1p}\Delta F_{it}^{p} + \beta_{2p} th_{it}^{3}\Delta F_{it}^{p} + \beta_{3p} th_{it}^{4,8}\Delta F_{it}^{p} + \beta_{1t}\Delta F_{it}^{t} + \beta_{2t} th_{it}^{3}\Delta F_{it}^{t} + \beta_{3t} th_{it}^{4,8}\Delta F_{it}^{t} + \varepsilon_{it} \qquad (2)$$

$\Delta F^{p}{}_{it}$ is the portion of the change in failures to deliver for security i from t+2 to t+3 that persists for five more days, if the change from t+2 to t+3 is positive. Likewise, $\Delta F^{t}{}_{it}$ is the portion of the change in failures to deliver for security i from t+2 to t+3 that does not persist for five more days, if the change from t+2 to t+3 is positive. In this model, β_{1p} is negative under the hypothesis that persistent failures to deliver depress prices. A negative β_{2p} would indicate that persistent failures to deliver depress prices in threshold securities more than they do in other securities. Adding β_{1p} to β_{2p} tells us the total effect on returns of a persistent fail in a threshold security. A negative β_{3p} would indicate that persistent failures to deliver depress stock prices more when they occur just prior to a security qualifying for the threshold list than at other times. Adding β_{1p} to β_{3p} tells us the total effect on returns of a persistent fail that contributes to a security qualifying for the threshold list.

Table 2 gives the estimated coefficients of the equation (2) regression estimated for failures to deliver aggregated by security on each date in a data set containing each security that is in our sample for at least one quarter in 2006.

Table 2: Results of a Pooled Regression of Returns on Decomposed Aggregate Fails

$$R_{it} = \alpha + \beta_{1p}\Delta F_{it}^{p} + \beta_{2p} th_{it}^{3}\Delta F_{it}^{p} + \beta_{3p} th_{it}^{4,8}\Delta F_{it}^{p} + \beta_{1t}\Delta F_{it}^{t} + \beta_{2t} th_{it}^{3}\Delta F_{it}^{t} + \beta_{3t} th_{it}^{4,8}\Delta F_{it}^{t} + \varepsilon_{it}$$

β_1 measures the effect on returns of trading that resulted in an increase in fails. β_2 measures the difference in effect on returns when the security is on the threshold list. β_3 measures the difference in effect on returns when the increase in fails contributed to threshold qualification. The effect on returns is given in basis points. Statistical significance at the 10, 5 and 1% level is indicated by *, **, or ***.

Measurement of Fails:	In units of 10,000 shares	In units of 1% of shares outstanding
α	61.42***	61.42***
Persistent fails		
β_{1p}	-7.67	-0.06
β_{2p}	7.44	0.05
β_{3p}	7.01	0.04
$\beta_{1p} + \beta_{2p}$	-0.23	-0.01
$\beta_{1p} + \beta_{3p}$	-0.66	-0.03
Transitory fails		
β_{1t}	-0.08	>-0.01
β_{2t}	0.27	0.01
β_{3t}	-0.01	<0.01
$\beta_{1t} + \beta_{2t}$	0.19	0.01
$\beta_{1t} + \beta_{3t}$	-0.08	<0.01

The results for persistent fails show that a prices decline of more than 7 basis points is associated with each 10,000 share increase in fails. While this result is economically larger than the result in Table 1, it is still not statistically significant. This means that there is too much statistical uncertainty to conclude that persistent fails have a negative impact on prices.

The marginal effect when a stock is on the threshold list is positive and nearly offsets the average negative effect on returns. This means that when a stock is on the threshold list, the effect on returns of a persistent fail appears less negative than when it is not on the threshold list. However, neither this marginal impact nor the total effect on returns of a persistent 10,000 share fail in a security on the threshold list is significantly different than zero. Therefore, we cannot conclude that a persistent 10,000 share fail in a stock on the threshold list has any association with returns. Likewise, the results do not allow us to say that a persistent 10,000 share fail is associated with an increase in fails that contributes to the security qualifying for the threshold list.

The persistent fail results are similar when fails are scaled by shares outstanding. A persistent fail of 1% of the shares outstanding does not have a statistically significant effect on returns, regardless of the threshold list status of the security.

The magnitude of the effect on returns of transitory fails appears much smaller than the effect on returns of persistent fails. However, because neither is statistically different from zero, it is

unlikely that they are statistically different from each other. Therefore, we can't conclude that one is larger than the other. In fact, the conclusions on transitory fails are the same as the conclusions on persistent fails. The effect on returns is insignificant, regardless of threshold status.

Results for Clearing Member Fails

One potential explanation for the lack of results on persistent and transitory fails is that the aggregate fails might not capture the persistent fails well if there fails come from multiple clearing members. Instead, a more accurate measure of persistent fails can be obtained by considering unaggregated fails, or fails at the clearing member level. We next repeat our analysis of persistent and transitory failures to deliver using persistent fails as estimated at the clearing member level. Specifically, for every clearing member in every stock, we decompose each increase in fails into persistent and transitory components. We then aggregate across clearing members to get new estimates of persistent and transitory fails for each stock on each day. This new estimate is different from the aggregate estimates above because a clearing member might have an increase in fails on a day when aggregate fails decrease for a security.

We re-estimate equation (2) using our new measures of persistent and transitory fails. The results are given in Table 3. As in Table 2, some of the effect on returnss appear positive and some appear negative, but none are statistically different than zero. Therefore, even when considering fails at the clearing member level, we have no evidence that trades resulting in failures to deliver push price down.

Table 3: Results of a Pooled Regression of Returns on Decomposed Clearing Member Fails

$$R_{it} = \alpha + \beta_{1p}\Delta F_{it}^{p} + \beta_{2p} th_{it}^{3}\Delta F_{it}^{p} + \beta_{3p} th_{it}^{4,8}\Delta F_{it}^{p} + \beta_{1t}\Delta F_{it}^{t} + \beta_{2t} th_{it}^{3}\Delta F_{it}^{t} + \beta_{3t} th_{it}^{4,8}\Delta F_{it}^{t} + \varepsilon_{it}$$

β_1 measures the effect on returns of trading that resulted in an increase in fails. β_2 measures the difference in effect on returns when the security is on the threshold list. β_3 measures the difference in effect on returns when the increase in fails contributed to threshold qualification. The effect on returns is given in basis points. Statistical significance at the 10, 5 and 1% level is indicated by *, **, or ***.

Measurement of Fails:	In units of 10,000 shares	In units of 1% of shares outstanding
α	200.27***	195.44***
Persistent fails		
β_{1p}	-1.31	-0.25
β_{2p}	0.90	0.01
β_{3p}	7.23	0.32
$\beta_{1p} + \beta_{2p}$	-0.41	-0.23
$\beta_{1p} + \beta_{3p}$	5.92	0.07
Transitory fails		
β_{1t}	-3.96	-0.02
β_{2t}	3.78	>0.01
β_{3t}	1.39	-3.32
$\beta_{1t} + \beta_{2t}$	-0.18	-0.02
$\beta_{1t} + \beta_{3t}$	-2.57	-3.34

Discussion of the results

In the tables above, we can find no evidence that trades resulting in failures to deliver are associated with either positive or negative price returns. This result holds whether a security is on the threshold list or whether the failures contribute to the security's threshold status. This result also holds whether we examine aggregate fails or clearing member fails. Because we are unable to find an association between fails and returns, there is no need to examine causation. Therefore, this analysis provides evidence that failures to deliver have no effect on prices and therefore, this analysis suggests that policies seeking to reduce failures to deliver are unlikely to significantly effect pricing efficiency or price discovery.

SUBJECT: Aggregate Daily Fails to Deliver Graphs

We have received comments that OEA fails statistics memorandum (see Fails to Deliver Pre- and Post-Regulation SHO, http://www.sec.gov/spotlight/failstodeliver082106.pdf) is inaccurate and misleading, and that Rule 203 of Regulation SHO has had no impact on fails to deliver. In the interest of providing more disclosure on the level of fails to deliver before and after Regulation SHO, we have included a set of graphs that shows the aggregate daily fails to deliver across all securities and by market.

The first set of graphs show the aggregate daily fails to deliver across all securities and by market. There is quite a bit of volatility in the aggregate daily fails to deliver over time. However, across all securities, there is a noticeable decline after Rule 203 of Regulation SHO becomes effective. The aggregate daily fails to deliver never drops below 500 million shares per day before Regulation SHO but after Regulation SHO the aggregate daily fails to deliver is regularly at or below 500 million shares per day. In addition, the spikes are also larger before Regulation SHO than after Regulation SHO. A similar pattern emerges for the graphs of NYSE, Amex, and Nasdaq/OTCBB/Pink Sheet securities. Archipelago securities show a substantial increase in fails to deliver after Regulation SHO. However, the sample is quite small and influenced by Archipelago's build-up of exclusive new listings after Regulation SHO.

The second set of graphs includes a trend line of the data. By fitting a trend line to the data, it is much easier to see the trend in fails to deliver over this time period. A downward sloping trend line suggests a decrease in fails to deliver over time. An upward sloping trend line suggests an increase in fails to deliver over time. For all but Archipelago, the graphs exhibit a downward sloping trend line.

We use all of the data we have available to us before and after the implementation of Rule 203 of Regulation SHO on January 1, 2005. The data, as reported by NSCC, covers all stocks with aggregate fails to deliver of 10,000 shares or more. The period from April

1, 2004 to December 31, 2004 is defined as the pre-SHO period.[1] The period from January 1, 2005 to August 31, 2006 is defined as the post-SHO period.

Appendix A provides some additional explanation of noticeable spikes in the graphs. Many of the large spikes in aggregate fails to deliver are due to very large fails in low-priced securities. We believe that the dollar value of fails may be a better measure of the magnitude of fails to deliver than the number of shares but are unable to provide that measure due to constraints in obtaining price data on all OTCBB and Pink Sheet securities. If we felt that measuring the dollar value of fails was worth pursuing, we may want to ask the NSCC if they can provide either the closing price or the dollar value of the fail in the fails data feed.[2]

We note that the graphs presented are intended to provide the reader with more information about fails to deliver over time. The graphs are not intended to replace the more rigorous analysis contained in the OEA fails statistics memorandum. We also note that Rule 203 targets fails in threshold securities, not fails across all securities. So, although we can learn something about the performance of the Rule from the aggregate fails across all securities, the OEA fails statistics memorandum also provides a number of other measures of performance, such as the number of threshold list securities and the aggregate fails to deliver of threshold list securities. In that memorandum, the OEA finds that the average daily number of threshold list securities declined by 38.2% and the average daily aggregate fails for threshold list securities declined by 52.4%.[3] Thus, a number of other important measures, in addition to aggregate daily fails to deliver, show declines after Regulation SHO. In the interest of brevity, we do not provide graphs of those statistics.

[1] August 9, November 3 and November 4, 2004 were missing from the dataset. The previous day's fails data was used to fill-in the missing data for these dates.

[2] It is worth noting that NASD Rule 3210 is based on the dollar value of fails. Thus, there is a regulatory need to calculate the dollar value of fails for some securities.

[3] Threshold list figures include only NYSE, Amex and NASDAQ securities that meet the threshold list requirements. Since no threshold lists were published prior to January 10, 2005, the threshold list securities must be determined by applying the Rule to historical data. We apply the same procedure for determining the threshold list during the post-Rule period. Thus, we independently determine the threshold list and do not rely on the threshold lists determined by the exchanges during the post-Rule period. There is little difference in results if the published threshold lists are used.

Appendix A
Spikes in the Graphs

Date(s)	Explanation
4/23/04	Large one-day fail (105 million) in United States Crude Intl. (USCI)
8/11/04-9/2/04	Large 17-day fail (1,347 to 299 million) in Prime Rate Investors. (PRRM)
9/13/04-9/15/04	Large three-day fail (927 to 449 million) in Prime Rate Investors.
9/20/04	Large one-day fail (258 million) in Prime Rate Investors.
9/22/04	Large one-day fail (699 million) in Prime Rate Investors.
10/6/04-10/12/04	Large three-day fail in Quantech Electronics Corp. (QANT) Large three-day fail in Integrated Software Development. (ITDJ)
10/15/04	Large one-day fail (625 million) in Nexia Holdings. (NXIA)
10/11/05	Large one-day fail (785 million) in Raven Moon Entertainment warrants. Raven Moon trades for less than a penny per share.
2/3/06	Large one-day fail (779 million) in Raven Moon Entertainment (RVMN) common stock. RVMN trades less than a penny per share.
3/13/06	Large one-day fail (371 million) in Gateway Distributors. (GWDB) GWDB trades for less than a penny a share.
6/20/06	Large one-day fail (305 million) in Blackout Media Corp. (BKMP) Blackout Media Corp. trades for less than a penny a share.

SUBJECT: Fails to Deliver Pre- and Post-Regulation SHO

We have seen some comments that the OEA analysis is inaccurate and misleading. However, we feel that the opposite is true. We have carefully applied a sound method of analysis to the fails data while the commenters that criticize our analysis have generally applied much less rigorous methods to their analysis.

Unlike the numbers generated by some of the commenters that criticize our analysis, the OEA numbers do not cherry pick any particular months to come up with a number. Instead, we use an event study methodology. Event study methodology is frequently used by academic scholars to measure the effects of Rule changes on the market. In a standard event study, data before and after the implementation of a rule are compared to each other.

We use all of the data we have available to us before and after the implementation of Rule 203 of Regulation SHO on January 1, 2005 and calculate average daily aggregate fails to deliver before and after the Rule. Effectively, this gives us a measure of the effect of the Rule on an average day. This limits any potential selection bias that could result for taking a shorter period before and after the Rule. This calculation method also limits the potential for selecting a time period that is biased by seasonality, short-term macroeconomic events, and noise in our measure.

Using this methodology, the OEA finds that average daily aggregate fails for all securities decline by 34%. The data, as reported by NSCC, covers all stocks with aggregate fails to deliver of 10,000 shares or more. The period from April 1, 2004 to December 31, 2004 is defined as the pre-Rule period.[1] The period from January 1, 2005 to May 31, 2006 is defined as the post-Rule period.

We should note that Rule 203 targets fails in threshold securities, not fails across all securities. So, although we can learn something about the performance of the Rule from the aggregate fails across all securities, the OEA analysis also provides a number of other measures of performance, such as the number and aggregate fails of threshold

Produced by OEA
Privileged and Confidential

SEC_OEA_FCIC_001021

securities. The OEA analysis finds that the average daily number of threshold securities declined by 38.2% and the average daily aggregate fails for threshold securities declined by 52.4%.[2] These statistics make a much stronger case for the success of the Rule, but are largely missing from the analysis done by commenters critical of our analysis.

[2] Threshold list figures include only NYSE, Amex and NASDAQ securities that meet the threshold list requirements. Since no threshold lists were published prior to January 10, 2005, the threshold list securities must be determined by applying the Rule to historical data. We apply the same procedure for determining the threshold list during the post-Rule period. Thus, we independently determine the threshold list and do not rely on the threshold lists determined by the exchanges during the post-Rule period. There is little difference in results if the published threshold lists are used.

SUBJECT: Fails to Deliver Pre- and Post-Regulation SHO

This memorandum provides summary data on fails to deliver through March 2007. It examines fails to deliver before and after the implementation of the Rule 203 of Regulation SHO. The data, as reported by NSCC, cover all stocks with aggregate fails to deliver of 10,000 shares or more.

Table 1 shows the average daily fails to deliver statistics pre- and post-Rule for all stocks with aggregate fails to deliver of 10,000 shares or more. All six measures show declines after Rule 203 was implemented. The period from April 1, 2004 to December 31, 2004 is defined as the pre-rule period.[1] The period from January 1, 2005 to March 31, 2007 is defined as the post-rule period.

- The average daily aggregate fails to deliver declined by 29.5% after the effective date of Regulation SHO.
- The average daily number of securities with aggregate fails of at least 10,000 shares declined by 5.8% after the effective date of Regulation SHO.
- The average daily number of fails to deliver positions declined by 15.1%.
- The average age of a fail position declined by 25.5% after the effective date of Regulation SHO.
- The average daily number of threshold securities declined by 39.0% from the pre- to post-Rule periods.
- The average daily fails of threshold securities declined by 52.9 %.

Table 2 shows the summary statistics for the securities that were on the published threshold lists from January 10, 2005 to March 31, 2007.

- The average daily number of threshold securities during March 2007 was 311.
- The average daily number of threshold securities declined by 26.7% from January 2005 to March 31, 2007.

[1] August 9, November 3 and November 4, 2004 were missing from the dataset. The previous day's fails data was used to fill-in the missing data for these dates.

Produced by OEA

SEC_OEA_FCIC_001023

Table 3 displays average daily threshold securities by market.

- For exchange-listed issues, the average daily number of threshold securities during March 2007 was about 2.45% of all issues.
- For all issues traded in the U.S. (including OTCBB and Pink Sheets), the average daily number of threshold securities during May 2007 was about 0.39% of all issues.

SEC_OEA_FCIC_001024

Table 1
Summary Statistics on Fails to Deliver
Pre- and Post-Rule

Measure	Pre-Rule	Post-Rule	Change	Percent Change
Number of Days	189	561		
Average Daily Aggregate Fails (millions)	810.7	571.6	-239.1	-29.5%
Average Daily Number of Securities	2735.5	2577.7	-157.8	-5.8%
Average Daily Number of Fail Positions	10747.1	9129.1	-1618.0	-15.1%
Average Age per Position (days)	35.7	26.6	-9.1	-25.5%
Average Daily Number of Securities on Threshold List	298.2	181.9	-116.3	-39.0%
Average Daily Aggregate Fails for Securities on Threshold List (millions)	131.6	62.0	-69.6	-52.9%

Notes:
1) Statistics are estimated using raw Continuous Net Settlement fails data from the NSCC that include securities with aggregate daily fails to deliver of 10,000 shares or more.
2) Threshold list figures include only NYSE, Amex and NASDAQ securities that meet the threshold list requirements. Since no threshold lists were published prior to January 10, 2005, the threshold list securities must be determined by applying the Rule to historical data. We apply the same procedure for determining the threshold list during the post-Rule period. Thus, we independently determine the threshold list and do not rely on the threshold lists determined by the exchanges during the post-Rule period. There is little difference in results if the published threshold lists are used.
4) The pre-Rule period is from April 1, 2004 to December 31, 2004. The post-Rule period is from January 1, 2005 to March 31, 2007.

2007	3	22	311.04	-26.70

Notes:
1) The first threshold lists were calculated for the January 7, 2005 settlement date. This threshold list became effective on January 10, 2005.
2) Statistics are calculated using data from the threshold lists published by NYSE, Amex, NASDAQ, and Archipelago.

Produced by OEA

SEC_OEA_FCIC_001026

Table 3
Average Daily Threshold Securities by Market
March 2007

Market Class	Number of Threshold Issues	Total Number of Issues	% of Total Issues
NYSE	52	3,570	1.46%
Amex	71	1,526	4.65%
Archipelago	4	32	12.50%
Nasdaq NM	65	2,786	2.33%
Nasdaq SC	15	540	2.78%
All Exchanges	207	8,454	2.45%
OTCBB	71	3,492	2.03%
Exchanges + OTCBB	278	11,946	2.33%
Other OTC	34	67,879	0.05%
Total	312	79,825	0.39%
OTCBB + Other OTC	105	71,371	0.15%

Notes:
1) Statistics are calculated using data from the threshold lists published by NYSE, Amex, Nasdaq, and Archipelago.
2) Dually listed securities are counted twice in the total number of issues for all exchanges (8,454). However, the number of dually listed securities is small. For example, there are approximately 11 securities dually listed on NASDAQ and the NYSE.
3) The total number of issues for Other OTC (67,879) includes securities not covered by the Rule. Regulation SHO's close-out requirement applies to any equity security of an issuer that is registered under Section 12 of the Exchange Act, or that is required to file reports pursuant to Section 15(d) of the Exchange Act. NASD Rule 3210, which became effective July 3, 2006, applies the Regulation SHO close-out requirements to these non-reporting OTC equity securities.

DATE: August 21, 2006

SUBJECT: Fails to Deliver Pre- and Post-Regulation SHO

This memorandum provides summary data on fails to deliver through May 2006. It examines fails to deliver before and after the implementation of the Rule 203 of Regulation SHO. The data, as reported by NSCC, cover all stocks with aggregate fails to deliver of 10,000 shares or more.

Table 1 shows the average daily fails to deliver statistics pre- and post-Rule for all stocks with aggregate fails to deliver of 10,000 shares or more. All six measures show declines after Rule 203 was implemented. The period from April 1, 2004 to December 31, 2004 is defined as the pre-rule period.[1] The period from January 1, 2005 to May 31, 2006 is defined as the post-rule period.

- The average daily aggregate fails to deliver declined by 34.0% after the effective date of Regulation SHO.
- The average daily number of securities with aggregate fails of at least 10,000 shares declined by 6.5% after the effective date of Regulation SHO.
- The average daily number of fails to deliver positions declined by 15.3%.
- The average age of a fail position declined by 13.4% after the effective date of Regulation SHO.
- The average daily number of threshold securities declined by 38.2% from the pre- to post-rule periods.
- The average daily fails of threshold securities declined by 52.4 %.

Table 2 shows the summary statistics for the securities that were on the published threshold lists from January 10, 2005 to May 31, 2006. On an average day, there were about 312 securities on the threshold list. These threshold lists securities had an average of 1,346 fails positions representing 189 million shares.

- The average daily number of threshold securities declined by 29.8% from January 2005 to May 2006.

Table 3 displays average daily threshold securities by market.

[1] August 9, November 3 and November 4, 2004 were missing from the dataset. The previous day's fails data was used to fill-in the missing data for these dates.

Produced by OEA

SEC_OEA_FCIC_001028

- For exchange-listed issues, the average daily number of threshold securities during May 2006 was about 2.18% of all issues.
- For all issues traded in the U.S. (including OTCBB and Pink Sheets), the average daily number of threshold securities during May 2006 was about 0.38% of all issues.

Table 4 shows additional summary statistics for securities on the published threshold lists from January 10, 2005 to May 31, 2006.

- Over this period, the average daily number of threshold list securities was about 312, representing about 189 million shares in fails in 1,347 fail positions.
- A total of 6,223 securities "graduated" from the threshold list since January 10, 2005, representing 4.5 billion shares in initial fails.[2]
- The 6 securities that have "persisted" on the threshold list since January 10, 2005 have seen their fails drop by 68.6%.

We also estimate the amount of grandfathered fails relative to total fails for threshold list securities for the period from January 7, 2005 to December 31, 2005. Since the NSCC fails data do not allow us to definitively identify new fails or grandfathered fails and when they are closed out, we need to make a number of assumptions to estimate this number. We assume any increase in fails for a particular clearing firm on a given day represents a new fail created on that day. We estimate the percentage of grandfathered fails relative to total fails for each day during our period and then average those percentages.

- The average daily percentage of grandfathered fails to total fails for stocks on the threshold list is estimated to be about 48%.

We also estimate how many fails that existed prior to the implementation of the Regulation SHO continue to persist. We compare the fails on January 3, 2005 to fails on March 31, 2006 for all stocks with aggregate fails to deliver of 10,000 shares or more.

- 99.2% of the fails that existed on January 3, 2005 are no longer outstanding as of March 31, 2006.

[2] Initial fails are the number of fails on the first day a security is included on the threshold list.

Table 1
Summary Statistics on Fails to Deliver
Pre- and Post-Rule

Measure	Pre-Rule	Post-Rule	Change	Percent Change
Number of Days	189	353		
Average Daily Aggregate Fails (millions)	810.7	534.7	-276.0	-34.0%
Average Daily Number of Securities	2,735.5	2,557.3	-178.2	-6.5%
Average Daily Number of Fail Positions	10,747.1	9,106.5	-1,640.6	-15.3%
Average Age per Position (days)	35.7	30.9	-4.8	-13.4%
Average Daily Number of Securities on Threshold List	298.2	184.4	-113.8	-38.2%
Average Daily Aggregate Fails for Securities on Threshold List (millions)	131.6	62.7	-68.9	-52.4%

Notes:
1) Statistics are estimated using raw Continuous Net Settlement fails data from the NSCC that include securities with aggregate daily fails to deliver of 10,000 shares or more.
2) Threshold list figures include only NYSE, Amex and NASDAQ securities that meet the threshold list requirements. Since no threshold lists were published prior to January 10, 2005, the threshold list securities must be determined by applying the Rule to historical data. We apply the same procedure for determining the threshold list during the post-Rule period. Thus, we independently determine the threshold list and do not rely on the threshold lists determined by the exchanges during the post-Rule period. There is little difference in results if the published threshold lists are used.
4) The pre-Rule period is from April 1, 2004 to December 31, 2004. The post-Rule period is from January 1, 2005 to May 31, 2006.

SEC_OEA_FCIC_001030

Table 4
Summary Statistics for Securities on the Published Threshold List
January 10, 2005 to May 31, 2006

Measure	Value
Average Daily Number of Stocks	311.6
Average Daily Aggregate Fails (millions)	188.6
Average Daily Number of Positions	1,346.6
Number of Graduates from Threshold List	6,223
Total Initial Fails of Graduates from Threshold List (millions)	4,454.4
Number of Persistent Threshold List Securities	6
Total Initial Fails of Persistent Threshold List Securities (millions)	15.3
Total Current Fails of Persistent Threshold List Securities (millions)	4.8
Change in Fails for Persistent Threshold List Securities	-68.6%

Notes:
1) Statistics are estimated using two data sources: (1) raw CNS fails data from the NSCC that include securities with aggregate daily fails to deliver of 10,000 shares or more; and (2) the threshold lists published by NYSE, Amex, NASDAQ, and Archipelago.
2) A "graduate" is a security that dropped from the threshold list during this period.
3) A "persistent" threshold list security is any security symbol that was continuously on the list during the entire period.

DATE: March 3, 2008

SUBJECT: Fails to Deliver Statistics in Threshold Securities

This memorandum provides summary data on fails to deliver from May 1, 2007 to January 31, 2008 (nine months).[1] In particular, we estimate the magnitude of trades that fail to deliver in threshold securities relative to the entire market. We also estimate how many securities persist on the threshold list for more than 17 days. The data, as reported by NSCC, cover all stocks with aggregate fails to deliver of 10,000 shares or more.

Trades can either settle on time or fail to deliver. One important way to measure the magnitude of fails to deliver in the market is to calculate the dollar value of trades that result in fails to deliver as a percentage of the dollar value of all trades. In particular, we estimate the dollar value of trades that fail to deliver by estimating the dollar value of newly created fails to deliver.[2] Since the close-out requirement of Regulation SHO Rule 203 pertains to threshold securities, we estimate the dollar value of newly created fails to deliver in threshold securities for each day and sum each settlement day over the nine months from May 1, 2007 to January 31, 2008 (189 settlement days). We calculate the dollar value of trading volume reported by NYSE Group, NASDAQ, Amex, and OTCBB over the nine months from May 1, 2007 to January 31, 2008 (191 trading days).[3] The dollar values below represent the nine month sums in billions of dollars:

Sum of dollar value of new fails to deliver in threshold securities (A)	$ 174
Sum of dollar value of trading (B)	$ 30,873
Percentage of trades that fail to settle within T+3 (100 × A/B)	0.56%[4]

We estimate that on an average day trades in threshold securities that fail to settle within T+3 account for approximately 0.6% of the dollar value of trading in all securities.

We estimate that on an average day over a nine month period from May 1, 2007 to January 31, 2008, there are approximately 50 persistent threshold securities. We define a

[1] The period includes both before and after the elimination of the grandfather exception of Rule 203 of Regulation SHO.

[2] New fails are estimated each day by summing any positive change in the fails to deliver from the previous day for each security-clearing firm combination. If a fail to deliver position for a security-clearing firm combination did not exist in our data for the previous day, we assume a zero position on the previous day.

[3] Dollar value of trading is obtained from each of the market's web sites.

[4] While we believe that the percentage calculated from the two sums is appropriate, we also calculate the percentage as a ratio of the averages. This alternative calculation yields 0.57%.

SEC_OEA_FCIC_001034

persistent threshold security as a security that has remained on the Regulation SHO threshold list for more than 17 consecutive settlement days and continues to have fails to deliver of 10,000 shares or more. We use the threshold lists published by NYSE, NYSE Arca, Amex, and NASDAQ to measure the number of consecutive days a security was on the threshold list. We merge that data with the NSCC fails to deliver data and drop any date where a security may remain on the threshold list but has no fails to deliver.[5]

We estimate that the majority of these persistent threshold securities are exchange traded funds and similar products.[6] We calculate that 350 unique securities were persistent threshold securities during this nine month time period. Of those securities, approximately 219 or 62.6% where identified as exchange traded funds or similar products.

[5] We note that it takes 5 consecutive days of fails to deliver below the threshold amount for a security to exit the threshold list. Therefore, securities that are in the process of exiting the threshold list may have little or no fails to deliver but will continue to show up on the threshold list after fails to deliver have been reduced below the threshold amount.

[6] We manually identify exchange traded funds, exchange traded notes, and closed-end funds using ETFguide.com and YAHOO! Finance web resources.

In comparing a period prior to the effectiveness of the current rule (April 1, 2004 to December 31, 2004) to a period following the effective date of the current rule (January 1, 2005 to February 29,2008) for all stocks with aggregate fails to deliver of 10,000 shares or more as reported by NSCC:

- The average daily aggregate fails to deliver declined by 13.3% after the effective date of Regulation SHO.
- The average daily number of fail to deliver positions declined by 8.9%.
- The average daily number of threshold securities declined by 41.0%.
- The average daily fails of threshold securities declined by 41.7%.

We should keep in mind that at this point (adding months that are 3 years away from the effective date of the original close-out provisions), we are likely measuring fluctuations in fails caused by macro-economic events or changes in trading volume.

- The average daily number of securities on the threshold list in February 2008 was approximately 404 securities which comprised 0.5% of all equity securities, including those that are not covered by Regulation SHO.

The preliminary evidence regarding the Grandfather exception elimination from our Office of Economic Analysis (through February 2008) indicates that average daily fail to deliver shares increased 17.1% in threshold stocks WITH listed options but declined 12.4% in threshold stocks WITHOUT listed options. While economic factors may partially explain this result, it provides us with more evidence to take action on the option market maker exception.

Response to accusations that the SEC is misleading the public about the impact of Regulation SHO on fails to deliver.
By Tim McCormick, OEA
June 25, 2007

We have been very clear in our testimony, our fails statistics in the public file (August 2006), and in our rule releases on how we measure the impact of the Rule. So, first of all, to accuse us of lying is just nonsense. To measure the effect of the Rule, we use PRE-SHO data (2004) as the benchmark because we want to know what fails were like before the implementation of Rule. We compare PRE-SHO data to POST-SHO data. It's the type of event study methodology used by many academics so we are not developing any new methodology to study fails to deliver. The methodology is easy to understand and proven. David Patch compares POST-SHO data (2005) to POST-SHO data (2006/2007) in his analysis. So, his analysis ignores all the improvements in fails that were achieved in 2005 during the first year of the Rule. So, while it may be useful in some contexts to look at the trend in fails to deliver from 2005 to 2007, David Patch's analysis is not a good method for measuring the effect of the Regulation SHO close-out rule.

As we get farther and farther away from Regulation SHO's original implementation date of January 1, 2005, it is less and less likely that any changes to aggregate fails have to do with Regulation SHO. Rather, any changes in aggregate fails are likely to be driven by other factors such as increases in trading volume. In fact, we note that trading share volume was 33% higher in the NYSE-listed stocks from January to May 2007 than during January to May 2005. Since increases in trading volume tend to result in increases in fails to deliver, the dramatic increase in trading volume confounds the comparison between 2005 and 2007 making it difficult to get an accurate representation of the effect of the Rule.

We should also note that David Patch looks at total fails for all securities but that the close-out rule applies to threshold list securities only. The SEC analysis examines a number of measures, including measures solely related to threshold securities, so our analysis is much better than his at measuring the impact of the Rule.

We will continue to monitor fails to deliver and plan on measuring the impact of the forthcoming elimination of grandfather exception.

Fails to Deliver Analysis - Fe…

Attached is the updated write-up. Feel free to edit as you see fit. I also attached some the updated tables where the numbers come from. I want anyone who uses these numbers to realize that we are 3 years past the original effectiveness of Reg SHO so the fluctuations in fails we are seeing now (and forward) cannot really be attributed to the impact of the Rule. Fails continue to go up. During the past four months, fails in exchange listed threshold stocks have risen to levels above the 2004 average. Unlike past increases in monthly fails that reverted to more normal levels in a month or two, these high levels continue to persist. Of course, if we didn't have Reg. SHO at all, fails may be 50-100% higher than they are now but that may not be something we want to emphasize.

Subject: dec 07 fails data oea.doc

Hi Tim,

The Chairman has a short sale speech and we'd like to give him some data with his short sale talking points. The latest I have is December (see attached) -- could you send us updates for this data? Thanks.

<< File: dec 07 fails data oea.doc >>

In comparing a period prior to the effectiveness of the current rule (April 1, 2004 to December 31, 2004) to a period following the effective date of the current rule (January 1, 2005 to February 29,2008) for all stocks with aggregate fails to deliver of 10,000 shares or more as reported by NSCC:

- The average daily aggregate fails to deliver declined by 13.3% after the effective date of Regulation SHO.
- The average daily number of fail to deliver positions declined by 8.9%.
- The average daily number of threshold securities declined by 41.0%.
- The average daily fails of threshold securities declined by 41.7%.

We should keep in mind that at this point (adding months that are 3 years away from the effective date of the original close-out provisions), we are likely measuring fluctuations in fails caused by macro-economic events or changes in trading volume.

- The average daily number of securities on the threshold list in February 2008 was approximately 404 securities which comprised 0.5% of all equity securities, including those that are not covered by Regulation SHO.

The preliminary evidence regarding the Grandfather exception elimination from our Office of Economic Analysis (through February 2008) indicates that average daily fail to deliver shares increased 17.1% in threshold stocks WITH listed options but declined 12.4% in threshold stocks WITHOUT listed options. While economic factors may partially explain this result, it provides us with more evidence to take action on the option market maker exception.

Notes:
1) The first threshold lists were calculated on January 7, 2005.
2) The data includes the threshold lists published by NYSE, Amex, Nasdaq, and Archipelago.
3) Excludes NASD Rule 3210 threshold securities.

Table 5
Average Daily Threshold Securities by Market
February 2008

Market Class	Number of Threshold Issues	Total Number of Issues	% of Total Issues
NYSE	74.7	3,338	2.24%
Amex	95.7	1,723	5.55%
Archipelago	42.2	300	14.07%
Nasdaq Global	89.6	2,726	3.29%
Nasdaq CM	14	539	2.60%
All Exchanges	316.2	8,626	3.67%
OTCBB	50.8	3,661	1.39%
Exchanges + OTCBB	367	12,287	2.99%
Other OTC	37.2	68,452	0.05%
Total	404	80,739	0.50%
OTCBB + Other OTC	88	72,113	0.12%

Notes:
1) Statistics are calculated using data from the threshold lists published by NYSE, Amex, Nasdaq, and Archipelago.
2) Dually listed securities are counted twice in the total number of issues for all exchanges (8,454). However, the number of dually listed securities is small. For example, there are approximately 11 securities dually listed on NASDAQ and the NYSE.
3) The total number of issues for Other OTC (67,879) includes securities not covered by the Rule. Regulation SHO's close-out requirement applies to any equity security of an issuer that is registered under Section 12 of the Exchange Act, or that is required to file reports pursuant to Section 15(d) of the Exchange Act. NASD Rule 3210, which became effective July 3, 2006, applies the Regulation SHO close-out requirements to these non-reporting OTC equity securities.
Amex and Archipelago numbers are preliminary.

DRAFT MEMORANDUM

TO: Distribution List

FROM: Office of Economic Analysis

DATE: June 2, 2009

RE: Comments on Shapiro and Pham Analysis of FTDs

This memo reviews the results of an April 2009 Sonecon, LLC study regarding failures to deliver (FTDs) ("the Shapiro study"). The study examines numerous measures of failures to deliver and concludes that Rule 204T does not go far enough to reduce fails. Instead, the study promotes a pre-borrow requirement. Upon close inspection, some of the statistics in the study confirm prior OEA results, though the interpretations may differ. The study also brings up some pertinent issues that should be considered. Overall, however, we caution against relying heavily on many of the results of the Shapiro study because some are based on measures we believe to be unreliable or subjective interpretations. The result that we find compelling is the finding of a positive relationship between short interest and fails but we do not believe that these results provide a firm economic foundation for a pre-borrow requirement.

The key points of the study and *a summary of OEA's comments (in italics)* are:

1) Regulation SHO has not stemmed failures to deliver. *This result is inconsistent with other studies and we are unable to replicate it, even with the same data.*
2) FTDs contributed to the collapses of Bear Stearns and Lehman Brothers. *This result is not based on rigorous econometrics or careful consideration of the timing of the FTDs. Further, economic analysis of FTD data, by itself, is not sufficient to prove or disprove manipulation by short sellers.*
3) FTDs contributed to the collapses of 355 companies with death spiral financing. *This analysis does not prove causation and companies that issue death spirals tend to be troubled before the financing.*
4) The study finds a positive relationship between short interest and fails. *This result is confirmed in other work.*
5) The study finds no relationship between changes in short interest and changes in trading volume. The study interprets this result as suggesting that short sales are not a pertinent factor for a stock's liquidity. *This analysis is not designed correctly to test for the connection between short selling and liquidity and the result is inconsistent with prior studies.*
6) The study cites Hong Kong, among others, as an example of a market where a pre-borrow and other short sale restrictions work well. *This analysis is inconsistent with prior studies and is not confirmed when it is broadened to other countries.*
7) The study argues that the July Emergency Order requiring a pre-borrow did not impair liquidity or raise costs for short sellers. *This analysis is inconsistent with prior studies.*

SEC_OEA_FCIC_001066

8) The study cites an Australian study that found that naked short sales increase volatility of stock returns and impair liquidity. *The regulatory regime in Australia is different enough that we wonder at the applicability of the result for the U.S.*

Our comments regarding these points:

1) **Regulation SHO has not stemmed failures to deliver.** The study finds that Rule 204T has led to a significant reduction in FTDs, but contends that it has not gone far enough. The study says that the top 3% of companies with fails averaged 9.9 million fails per security in December 2008, almost as large as the 11.6 million fails per security in July 2008.

Comments: While it is true that FTDs have not gone to zero, OEA finds that FTDs have declined drastically, particularly in individual stocks.[1] There are a number of reasons that the Shapiro study differs from the OEA study. First, the Shapiro study focuses on the worst 3% and ignores the other 97% of companies with FTDs (in addition to companies that had less than 10,000 shares in FTDs that month). Examining this small segment of companies does not give you a representative picture of the effect of the rule changes across all companies. Second, the statistics in the Shapiro study cannot be replicated even with the same data.[2] According to the data, the average company in the top 3% of fails had 2.4 million in fails per day during December 2008 compared to 5.3 million in fails per day during July 2008. Therefore, the results from the raw data indicate that even the top 3% of companies with fails saw a significant drop in fails after the close-out provisions of Regulation SHO were tightened. Third, analyzing the top 3% of companies with fails over time can be problematic because the top 3% changes over time, making it difficult to interpret the results. The number of companies that have fails to deliver changes over time resulting in changes in the number that qualify for the top 3% – 233 in July 2008 and 172 in December 2008. Also, the company mix changes over time as companies fall out or enter this group. We note that only 36 securities are included in the top 3% of fails in both July 2008 and December 2008.

2) **FTDs contributed to the collapses of Bear Stearns and Lehman Brothers.** The study argues that naked short sales and fails played a role in the abrupt, unmanaged and widely disruptive collapses of Bear Stearns and Lehman Brothers.

Comments: The increases in FTDs around the collapses has been examined by OEA and referred to Enforcement. However, OEA determined that the timing of the Bear Stearns FTDs was inconsistent with the FTDs causing the collapse. Like the OEA analysis, the Shapiro study doesn't provide any definitive evidence that FTDs (or naked short sales)

[1] There have been smaller reductions in FTDs in exchange traded funds and other tradable investment products. However, exchange traded funds are much less susceptible to "bear raids" because their fundamental value or NAV is well-known and their structure provides for easy arbitrage of any deviations from NAV.

[2] The Shapiro study used the FTD data available publicly from the SEC web site.

SEC_OEA_FCIC_001067

could have caused these firms' collapses. In particular, the Shapiro study does not satisfy the rigorous econometric standards for proving cause and effect, nor do the interpretations meet less careful standards. In particular, the study does not take into account the timing of events. A good event study is designed meticulously to isolate the exact timing of the event and to look at a suitable period before and after the event. The monthly averages used in the Shapiro study are not precise enough for this purpose because the key events happened in the middle of the relevant months. Further, most of the increase in FTDs in these two firms actually occurred in the days following important news of their respective financial situations, so recognizing the timing of the FTDs is particularly important.

The study also examines the Bear and Lehman events using short interest and FTDs as a % of short interest. Short interest appears to have increased for both of these companies over time. However, the Shapiro study does not question whether the increase was due to abusive short selling or short selling from concerns regarding the financial conditions of these firms. Therefore, the evidence on short interest says little about whether additional short sale regulation would have prevented the events. Also, we are not sure how to properly interpret results on the ratio of FTDs to short interest. The Shapiro study uses the ratio as measure of abusive short selling where a high ratio suggests a greater degree of manipulative short selling. While perhaps intuitively appealing, we do not agree with this interpretation. For example, if FTDs were 100 shares and short interest was 100 shares, the measure yields 100% or a high degree of manipulation. However, it is unlikely that anyone would argue that a stock with a small degree of FTDs and short interest was being manipulated by short sellers. Also, short interest is snapshot of one day twice a month while FTDs are daily snapshots. Given the different frequencies, the ratio can be estimated in several ways with the construction potentially affecting the results. The study does not explain how this measure is estimated, or whether the results are robust to its construction.

3) FTDs contributed to the collapses of 355 companies with death spiral financing.

Comments: Death spiral financing refers to a way for a company to raise money by privately issuing a convertible security (often a preferred stock) that converts into common stock at some point in the future at a price based on a future market price. The number of shares in the conversion varies with the conversion price to hold the total value constant. This provides a hedge on the short term movements in the price of the common stock, but the holders of the convertible still have economic long exposure based on price movements after the conversion. To hedge this risk, the financiers often short the common stock.[3] The lower the stock price, the more shares in the conversion, so the bigger the short position required for this hedge. Therefore, the holders of the convertible will close part of their position when the stock price rises and increase the short position when the stock price falls. Further, the conversion price is often at a discount from the market price, providing incentives for manipulation and arbitrage

[3] Some contracts forbid the financiers from shorting the stock.

SEC_OEA_FCIC_001068

strategies. The Commission had pursued manipulation cases involving naked short sales related to death spirals.

The economic literature finds that companies issuing death spiral financing are not financially healthy and tend to underperform companies with other financing alternatives. Therefore, the fact that 355 companies with death spiral financing did not survive is not surprising and may be unrelated to FTDs. Therefore, the business failures would not necessarily have been prevented by a pre-borrow requirement.

An increase in the FTDs of the death spirals does suggest some naked short selling and potentially some manipulative behavior. However, the analysis cited is not sufficient for proving the manipulative behavior as it does not apply the rigorous econometrics required analyses of causation.

Because so many troubled firms seemed to suffer as a result of issuing death spirals, the use have death spiral financing has waned in recent years. While it is possible for newer financial instruments to contain certain elements rendering them susceptible to incentives similar to those in classic death spirals, we do not recommend applying a regulation to all stocks based on experiences drawn from financing techniques used by a minority of issuers.

4) **The study finds a positive relationship between short interest and fails.**

Comments: The study finds a relationship that is consistent with OEA work and a forthcoming GAO Report. Across the cross-section of exchange traded products, OEA finds that short interest is positively related to FTDs. The GAO Report finds that the time series of aggregate FTDs are highly correlated with aggregate short interest.

5) **The study finds no relationship between short interest and trading volume.** The study interprets this result as suggesting that short sales are not a pertinent factor for a stock's liquidity.

Comments: Actually, the study finds no relationship between changes short interest and changes in trading volume. This is an important distinction for a few reasons. First, trading volume is a "flow" variable, meaning that it is already capturing changes. We aren't sure how to interpret what a change in trading volume means in this context, except that it does not capture liquidity. (Note that the academic literature tends to favor measures of liquidity other than trading volume.) Second, short interest is a "snapshot" variable, so the change in short interest could be appropriate except that it doesn't necessarily measure the volume of short selling well, which is what the study is trying to examine. Therefore, the results in the Shapiro study should not be interpreted to suggest that short sales are unimportant for liquidity.

The academic literature, on the other hand, provides support for the conclusion that short selling generally improves market quality. For example, Boehmer, Jones and Zhang (2009) analyzed the SEC ban on short sales and found that it resulted in a significant

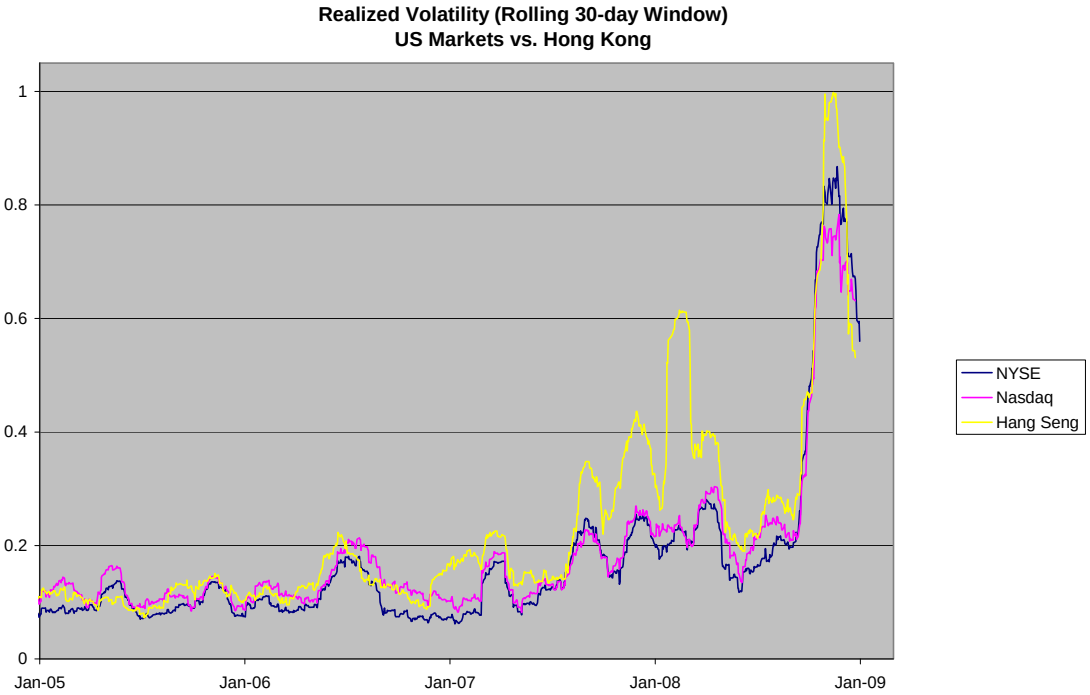
SEC_OEA_FCIC_001069

deterioration in market quality. The Shapiro study does not reconcile its results to these other results and explain why its methods are superior. Our opinion is that the methods in the academic literature are likely to be more reliable, because, as explained above the Shapiro study does not address the question correctly.

6) **The study cites Hong Kong, among others, as an example of a market where a pre-borrow works well.**

Comments: There is also evidence to the contrary. An academic paper by Chang, Cheng, and Yu (2007) finds an overvaluation effect in Hong Kong due to short sale constraints which suggests that price discovery is impaired. Additionally, according to recent HK data, short sales only account for about 8% of volume in Hong Kong stocks. This suggests that, relative to short selling in UK and US, short selling is severely impaired in Hong Kong.

In addition, the evidence cited shows that the U.S. experienced an increase in volatility last fall that was sharper than the increase in volatility in Hong Kong. An OEA analysis shows that this is not true over a longer time horizon (see chart below). In fact, when looking at the entire crisis starting in 2006 or 2007, there appears to be no correlation between the increases in volatility and short selling restrictions. In other words, all countries experienced increases in volatility with some countries with more restricted short selling experiencing higher increases than the U.S. and others experiencing lower increases.



7) The study argues that the July Emergency Order requiring a pre-borrow did not impair liquidity or raise costs for short sellers.

Comments: The study provides no actual evidence to support this argument and the argument runs counter to evidence. For example, OEA's analysis of the effect of the July Emergency Order suggested that imposing a pre-borrow requirement may have resulted in significant costs for all short sellers. Specifically, the cost to borrow stock increased and short selling decreased. OEA also noted that only a few stocks were subject to the Emergency Order and those had larger market capitalization and more liquidity in the equity lending market than the typical stock. Therefore the results of analyses of the July Emergency Order (both OEA's and others cited in the study) may underestimate the impact of any pre-borrow rule on smaller stocks.

8) The study cites an Australian study that found that naked short sales increase volatility of stock returns and impair liquidity.

Comments: The Australia experience may not be relevant to the U.S. trading and regulatory framework. A naked short-sale in Australia is where the participant, either proprietary or on behalf of a client, enters an order in the market and does not have in place arrangements for delivery of the securities. Effectively, Australia requires a pre-borrow prior to short sales in most securities but allow short sales in some securities to occur without any pre-borrow requirement. According to the study, Australia's relaxation of pre-borrow requirements for some stocks led to harmful effects on their market quality. It appears, however, that Australia has ended this experiment. Effective November 14, 2008, Australia permanently banned naked short selling, suggesting that the old regulatory framework was inappropriate. However, on April 30, 2009, the Australian Securities and Investments Commission issued a consultation paper requesting feedback on relaxing their ban on naked short selling for market makers. In summary, it appears that Australia is still searching for the appropriate regulatory regime for naked short selling.

The Australian experience is an interesting one, and we plan to summarize this study along with others on FTDs/naked short selling in a separate document. However, we suggest caution in reading too much into this result. The differences in regulation between the stocks on the Australian naked short list and others is much greater than the difference between Rule 204T and a pre-borrow requirement (or even the pre-Rule 204T and a pre-borrow requirement). In particular, the stocks on the naked short list in Australia had much less short selling or delivery regulation than stocks in the U.S. The delivery of securities in the U.S. relies on a number of rules such as the locate and close-out requirements that didn't exist in Australia. In other words, the old Australian regulatory environment allowed for short sales to occur without a pre-borrow, without a locate, and without any FTD close-out requirements. We plan to monitor for additional empirical analysis on the developments in Australia to look for lessons that can be applied in the U.S.

SEC_OEA_FCIC_001071

Other notes:

1) The study confuses FTDs with naked short sales. There are several circumstances in which FTDs do not appear to be due to naked short sales. Therefore, we are hesitant to regard FTDs as anything but a noisy proxy for naked short selling. We are currently reviewing another study that more directly asks whether FTDs are a good proxy and we plan to summarize that study in a separate memo.
2) In footnotes 2 & 9, the study is incorrect in its statement that the "OEA memo uses daily average FTDs on two random days, July 17, 2008 and December 31, 2008. In reality, the OEA analysis uses daily averages across many months of data both pre- and post-Rule changes. The word "random" is not in the memos.

SEC_OEA_FCIC_001072

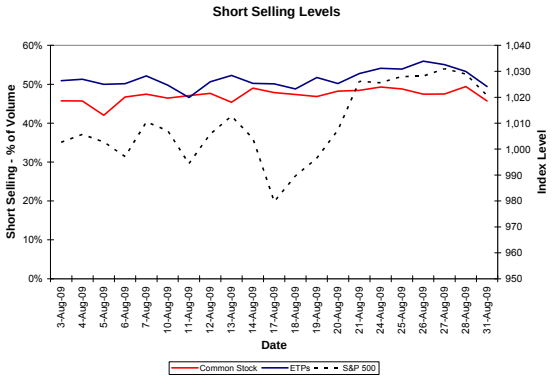
DRAFT for Comments

Monthly Short Selling Report

Total Short Selling

In August 2009, short selling accounted for **48%** of reported volume in common stocks found in the daily short selling volume data.[1] This level was fairly constant throughout the month and did not fluctuate much with the market, as reflected in the S&P 500 index levels (2% correlation coefficient).

Short selling of exchange traded products (ETPs) in August was slightly higher than that of common stock at 52%. This level did not vary much throughout the month, but it does seem to vary a little with the level of the S&P 500. In particular, the level



of short selling in ETPs seems to decline when the S&P 500 declines (29% correlation coefficient).

Note that these levels are quite higher than they were during the Regulation SHO Pilot. There are several potential reasons, but we have not yet run tests on why the level of short selling has increased so much.

Most-Shorted Securities

The daily data is also useful for identifying the most shorted securities. OEA plans to provide lists of the most shorted securities but does not plan to investigate the trading in these securities. In time, this list could change to a list of unusual short selling instead of high short selling.

In August, the stock most shorted was Insulet Corp. Short sales made up 68.3% of the share volume. The shorting in Insulet seemed higher when prices were rising as the level of short selling has a positive 39.4% correlation with the stock returns in Insulet. In addition, the price of Insulet Corp. rose 37.5% in the month of August.

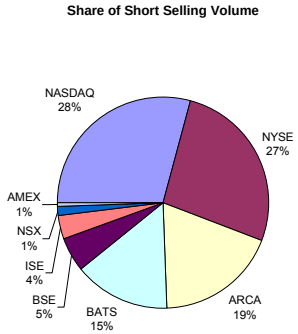
Many of the securities that were shorted the most in August had prices that went up and had short selling that was positively correlated with returns. These securities are unlikely candidates for manipulation.

Ticker	Name	Short Level	Correl	Return
	Common Stock			
PODD	Insulet Corp.	68.3%	39.4%	37.5%
MPWR	Monolithic Pwr	67.2%	8.6%	1.5%
RDK	Ruddick Cp	66.8%	-1.1%	13.0%
PNFP	Pinnacle Fn Prt	66.7%	28.2%	3.5%
WIT	Wipro Ltd	65.1%	-18.4%	-7.8%
	ETPs			
VIG	Vanguard Dvd	78.0%	6.6%	2.4%
PGX	PwrShares Pfd	77.4%	4.0%	-1.5%
QQQQ	PwrShares QQQ	67.6%	51.6%	1.5%
ITB	Home Cnstrctn	67.3%	-27.9%	-7.8%
FCG	Natural Gas	67.2%	0.3%	2.3%

For some other stocks or ETPs, the correlation between the short selling level and the stock return is negative and a few of these had a negative return in August. The short selling in these securities is not necessarily abusive and much more analysis would be necessary to determine manipulative intent. A negative correlation could indicate that short sellers applied price pressure without any manipulative intent or that they were merely passive momentum traders.

Market Share

We also examined which markets tend to account for more short selling.[2] Some strategies may involve shorting only on certain exchanges. We found that the markets' share of short selling



coincided closely with the markets' share of volume, with no market deviating by more than 1%. We will monitor this over time.

[1] This might be an overestimate because stocks that have no short selling may not show up in the data. In addition, our classification into common stock is imperfect and based on characteristics of the ticker and absence from a list of ETPs.

[2] FINRA has not yet started to disseminate the volume data, so this analysis does not reflect TRF activity.

The following table describes convertible bond hedging activity as a percent of (1) shares outstanding and (2) short interest. The amount of hedging activity needed is the theoretical prediction from a proprietary model (CNH Partners) based on credit, volatility, and delta estimates from 9/25/2008; hence, this may not reflect that actual convertible arbitrage positions. The amount of short interest outstanding is as of 9/15/2008. This analysis covers approximately 84% of the outstanding market.

		By unique issuer				
	Issue size ($)	Shares out	Hedge needed on 9/25/08 (# shares)	Short interest on 9/15/08	Hedge as % of shares out	Hedge as % of short interest
Panel A: All convertible bond issues						
Number	585	459	459		459	
Mean	404,279,915	210,845,394	6,880,878		7.13%	
Median	240,000,000	65,973,000	2,855,146		5.38%	
Standard dev	502,825,861	505,942,381	29,656,704		7.67%	
Total	236,503,750,000					
Panel B: Convertibles with underlying equity traded on NYSE						
Number	313	249	249	249	249	249
Mean	404,279,915	225,854,225	7,133,787	15,317,479	7.14%	48.26%
Median	240,000,000	67,922,000	2,990,715	7,692,121	5.41%	42.70%
Standard dev	502,825,861	505,297,880	28,389,631	26,965,434	7.68%	33.80%
Total	152,615,046,000					

Panel A represents only those issues for which we have full data (approximately 84% of total outstanding issues)

Panel B is for NYSE stocks only; hence, short interest on 9/15/08 available.

The first column includes multiple issues by the same issuer. All other columns represent the aggregated amount of all issues by the same issuer.

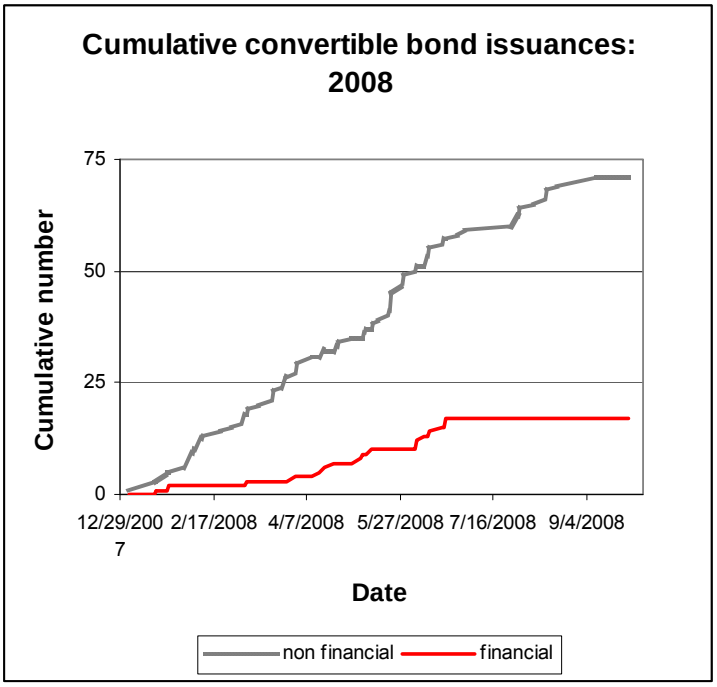
Re: A brief survey of current market conditions for convertible bonds, and the potential effects of short sale restrictions

The following document provides a short summary of the current market conditions for convertible bonds: the subject of much speculation since convertible bond arbitrage strategies rely on the ability to short the underlying stock.

The following table and graph describe the frequency and type of new convertible bond issuances since the beginning of 2008. This data provided by CNH Partners. There are 89 total issuances included (Original source is Merrill Lynch), but other sources indicate that some deals are omitted: Prospect news claims that there are 109 deals to date. I have not reconciled this difference.

YTD convertible bond issuance through 9/24

	Non financial issuers	Financial issuers	All issuers
Number of issuances	71	18	89
Percent of total	*80%*	*20%*	*100%*
Proceeds ($ millions)	27148	30645	57793
Percent of total	*47%*	*53%*	*100%*



Of note, there has not been a single issuance since September 9th, and the last issuance by a financial firm currently on the short sale list is June 20th. Hence, this market dried up prior to the current short sell restrictions. Also of note, financial firms comprise 47% of the dollar volume of issuance but only 20% of the total issuances. This is a result of a few very large issuances by financial firms, illustrated in the following list of the 25 largest issuances since the beginning of the year. Fourteen of these issuances are by financial firms currently on the short sale list (listed in bold).

	Issue Name	Stk Ticker	Issue Date	Proceeds $mm	Pct Cheap At Issue
1	**Bank of America Corp 7.25% Pfd.-L**	**BAC**	**1/24/2008**	**6900**	**8.13%**
2	**American Intl Group (Mand) 8.5% Pfd.**	**AIG**	**5/12/2008**	**5880**	**6.02%**
3	**Wachovia Corp 7.5% Pfd.-L**	**WB**	**4/14/2008**	**4025**	**11.71%**
4	**Lehman Bros Ch. 11 7.25% Pfd.-P**	**LEH**	**4/1/2008**	**4000**	**12.78%**
5	**Citigroup Inc 6.5% Pfd.-T**	**C**	**1/17/2008**	**3169**	**4.98%**
6	**Fannie Mae (Mand) 8.75% Pfd.**	**FNM**	**5/8/2008**	**2588**	**5.36%**
7	**Lehman Bros Holdings Inc Ch. 11 (Mand) 8.75% Pfd.-Q**	**LEH**	**6/9/2008**	**2000**	**6.90%**

23	SBA Communications Corp 1.875% 05/01/13 (144A*)	SBAC	5/13/2008	550	3.78%
24	XM Satellite 7% 12/01/14 (144A*)	SIRI	7/29/2008	550	8.92%
25	ProLogis 2.625% 05/15/38	PLD	5/1/2008	545	0.65%

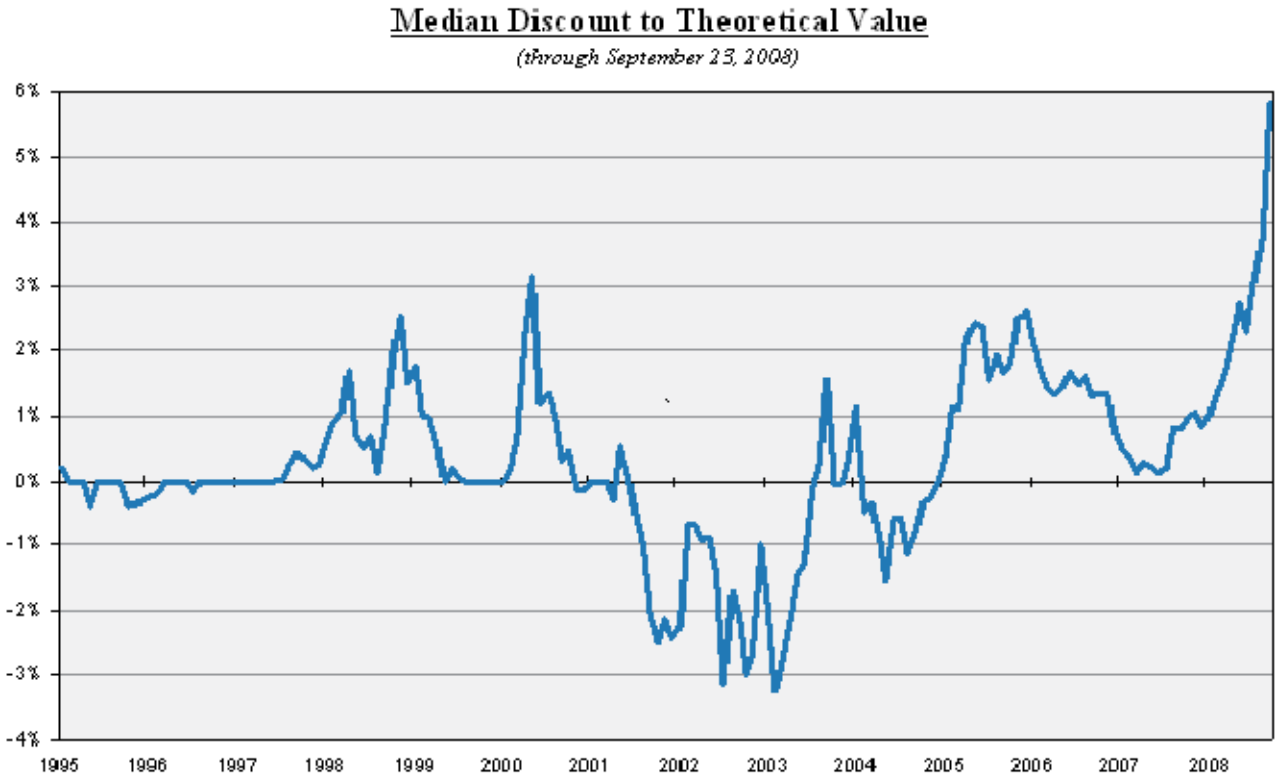
One of the chief concerns about the short sale restrictions is that it may limit the ability of certain issuers to raise capital. Over 75% of convertible bonds are held by hedge funds exercising convertible bond arbitrage strategies.[1] This arbitrage strategy calls for a short position in the underlying equity of the issuer that increases as the conversion feature of the bond comes into the money. This eliminates any upside gain of stock price increases above the conversion price, but also makes the investment market neutral if the hedge is properly balanced. Hence, the strategy can be levered up through borrowings to magnify the otherwise modest return on the bond yield.

Since hedge funds can profit from lower convertible bond yields through this arbitrage, it also makes these issuances attractive for issuers who can access capital markets at lower cost than a straight debt issuance, particularly if they are an unrated or higher risk than a typical debt issuer. The recent increase in issuances by the financial sector is evident of this; the convertible feature of the debt issuances allowed them to raise capital at a lower cost; purchasers were willing to accept a lower yield since they could hedge against the downside risk by shorting the underlying stock. Since new short positions are no

[1] A claim made by CNH Partners

longer allowed, this source of capital may no longer be viable. Moreover, risk of future short-selling restrictions is currently blamed for the entire market seizing up: there have been no new issuances since September 9.

The short sell restrictions are also problematic for current convertible bond portfolios. To maintain a risk neutral position, arbitragers must continually rebalance their short positions to match the moneyness of the bond. To the extent that new short positions are not allowed, managers cannot rebalance their portfolio. Moreover, since short positions are not transferable, transferring bond positions between bond fund mangers is also problematic. A currently hedged bond will lose its hedge if sold. This supports claims that liquidity for these instruments has disappeared, increasing their discount. The following plot courtesy of CNH Partners illustrates the time series discount applied to these bonds relative to their theoretical value (calculated from the bond's intrinsic characteristics).



The discount has risen sharply since the beginning of the year, and is now over 8%, and is well above other historical spikes, most notably the Long Term Capital Management debacle in 1998, the high tech bubble burst in 200, and large changes in basis risk (total market risk) in 2005 related to GM and Ford credit downgrades.

The next table lists the discounts applied to convertible bonds on two dates either side of the September 19 short sale restrictions, and it is broken out by whether the issuer is a financial firm. For this analysis, only issuances with a moneyness of 0.65 or greater are included (implying that shorting is an active component of the strategy). Although the largest increases to the discount are found among financial firms, and increase from 6.87 to 8.66 on average, the change in not statistically significant. Other assumptions of moneyness or the use of medians instead of means does not materially alter this conclusion. Hence, it is difficult to interpret the increase to be a result of the short sale ban.

		Bond discount to theoretical

SEC_OEA_FCIC_001080

Summary of Paper & Comments

- **Matched pairs approach**
  - Match on market cap, dollar volume and exchange listing
  - 464 “banned” stocks versus 464 “non-banned” stocks
    - Reasonably good match, except banned stocks tend to have higher share volume (& lower prices) than their matches
    - Table 2: Missing info on the 61 “ban-list later” matches
- **Two-way fixed effect panel regressions**
  - Controls for daily effects and matched pair effects
  - Very important during this extreme period
  - Assumes: Time trends in absence of ban would have been same
    - Spillover effects – potential bias could run either way
    - Extreme degree of news regarding financial firms – potential bias in favor of the results (differential effects around extreme events)
  - Of course, any benchmark can be criticized to some extent

SEC_OEA_FCIC_001081

Summary of Paper & Comments

- **Ban impact:**
  - Relative short sale volume decreased from 22% to 11%
  - Relative effective spreads increased by 56 bp
    - Relative spreads sensitive to changes in price level
    - Alternative: Quartiles of ban stocks by price decline
      - Also helps with concern about differential effects from news
    - Alternative: Correct relative spreads for price changes
  - Short sales were more aggressive
    - Does this indicate a loophole being exploited?
    - Did firms register as market makers in order to avail themselves of the exemption?
  - Large, temporary increase in prices (CONFOUNDED!)
  - Average trade size falls – consistent with SS constraints making it harder to do arbitrage
- **Evidence that Rule 204T reduced short selling**
  - Cost to borrow stocks may have gone up

SEC_OEA_FCIC_001082

Mechanical Impact of Price Decline on Relative Effective Spread

	Pre	Post	Change
Banned Stocks			
Average Price	20.00	16.00	-20%
Average Spread - Actual ($)	0.20	0.18	-0.02
Relative Spread - Actual (bps)	100.0	112.5	+12.5
Relative Spread - Adjusted (bps)	100.0	100.0	0.00
Non-Banned Stocks			
Average Price	40	40	
Average Spread - Actual ($)	0.40	0.40	0.00
Relative Spread - Actual (bps)	100.0	100.0	0.00
Difference in Actual Relative Spreads		**+12.5**	
Difference in "Adjusted" Relative Spreads		**0**	

Assumes that spreads fall by 0.5% for every 1% change in price.

SEC_OEA_FCIC_001083

Circumstances Prior to SEC Ban

- March 2008: Lender/counterparty panic and "rush" sale of Bear Stearns
- July 2008: SEC temporary pre-borrow rule for 19 large financial firms
- Sept 8, 2008: Fannie Mae and Freddie Mac government rescue
- Week of Sept 14th:
  - Sunday: Lehman declares bankruptcy, Merrill Lynch's "rush" sale to BOA
  - Tuesday: Money market fund at Reserve Management Company "breaks the buck" causing "run on bank" in money market funds
  - Tuesday: AIG's government rescue
  - Wednesday: Morgan Stanley CEO John Mack memo to employees: "What's happening out there? It's very clear to me -- we're in the midst of a market controlled by fear and rumors, and short sellers are driving our stock down."
  - Thursday: Price patterns in a number of stocks suggest "panic" selling
    - MS and GS hit 52-week lows on Sept 18th . Collapse 67% and 44% for week before recovering late in day.
    - Stocks rally late in day on reports of financial rescue plan.
  - Thursday night: Paulson, Bernanke, & Cox meet with Congressional leaders on a financial rescue plan, announce agreement to work quickly toward a "fix".
    - Bernanke warns, "If we don't do this, we may not have an economy on Monday."

SEC_OEA_FCIC_001084

Why Ban Short Selling?

- (Former) Chairman Cox (December 31, 2008 Reuters article):
  - The SEC imposed the temporary ban under intense pressure from the Federal Reserve and Treasury Department which insisted it was crucial to the short-term survival of these institutions, Mr. Cox said.
- Commissioner Paredes (Feb 2009 speech):
  - "From my perspective, the ban was not directed at shoring up particular issuers for their own sake or lifting stock prices as such. Such goals fall outside the Commission's ambit. Rather, the purpose was to protect the financial system against systemic risk."
  - "For me, it boiled down to determining if the ban might help stabilize the situation, the ban's potential benefits justified its costs, particularly given that the ban was temporary."
- Managing "market disruptions" within purview of regulators and SROs
  - Marketwide circuit breakers and individual stock trading halts
  - Breaking trades that fall far outside normal prices
  - Ironically, in an attempt to manage disruption, some believe that short ban may have led to disruption

Comments on the Impact of Ban

- **Commissioner Paredes (Feb 2009 speech):**
  - **"Speaking personally, it became apparent that the ban did not stabilize the markets but did result in inefficiencies and other market dislocations and disruptions. In short, the benefits of the ban did not materialize but the costs clearly did."**
- **Chairman Cox (as reported by Reuters)**
  - **"Preliminary findings point to several unintended market consequences and side effects caused by the ban"**
  - **"The costs appear to outweigh the benefits."**

Other Suggestions for Paper

- Expand discussion of events leading up to ban
- Expand discussion of events contemporaneous to ban
  - Financial rescue plan news confounds returns on 9/19/08 and potentially other days
  - Utilize specific examples to tell story about why ban affected markets
  - Ending the ban to minimize market disruption
  - Improve Rule 204T discussion
    - It was not a pre-borrow requirement
    - It did not ban fails due to short sales
    - Led to a 12.49% increase in prices on 9/18/08?
  - Form SH disclosure of short sales and positions
    - Rule issued on 9/18/08 and effective 9/22/08 to 8/1/09
    - Were short sellers scared off by disclosure?
- Add more short sale data beyond NYSE and Nasdaq
  - May be missing 30% of short sales

SEC_OEA_FCIC_001088

Avenues of Further Investigation

- Examine spillover in non-banned stocks
- Examine spillover & potential unlinking to NAV in ETFs
- Examine spillover, market quality, unlinking in option markets
- Examine spillover & unlinking in CDS markets

SEC_OEA_FCIC_001089

Numerous academic studies have examined last fall's ban on short selling, almost uniformly highlighting the costs of the ban. Not surprisingly, these studies find that short selling declined during the ban. In addition, the studies find the ban resulted in a severe reduction in market quality, including lower liquidity and higher volatility. Optionable stocks seemed to experience larger effects than other stocks. The ban also harmed the ability of issuers to raise capital, particularly for convertible bond issuances. Given the confounding effects at the start of the ban, it is not surprising that studies are mixed on whether the ban impacted prices. Overall, these results support the statements of former Chairman Cox that the ban was not productive.

Fails to Deliver in Short Sale Ban Stocks - Sample

Short sale ban stocks showed a dramatic decrease in fails starting on September 23, 2008 (see Figure 1). In fact, fails in short sale ban stocks declined by about 45.0% from September 22, 2008 to September 23, 2008. Fails in short sale ban stocks declined by about 77.1% and fails in non-ban stocks declined by about 36.3% from September 22, 2008 to September 30, 2008. A similar picture emerges when we use dollar value of fails (see Figure 2).

Another noticeable thing about the charts is the run-up in fails prior to the formal release of the new T+3 close-out rule. In particular, there were news reports on September 16th about the forthcoming rules and there is clearly a large increase in fails on corresponding to that trade date (September 19th settlement date). The chart is consistent with the conclusion that traders were failing to deliver, at least in large financial stocks where the threat of short sale restrictions was the greatest, in anticipation of new rules.

September 23, 2008 was first settlement date we may see some close-outs from the new T+3 close-out rule if the close-out was through borrowing stock. If close-outs were done through trades on September 23, 2008, we would not see it in settlement data until September 26, 2008. The first trading day of the short sale ban would show up on the September 24, 2008 settlement date. Since the initial impact of T+3 close-out rule and the short sale ban occur at the same time, it is hard to attribute any effect from September 24, 2008 onward to one or the other.

Figure 1

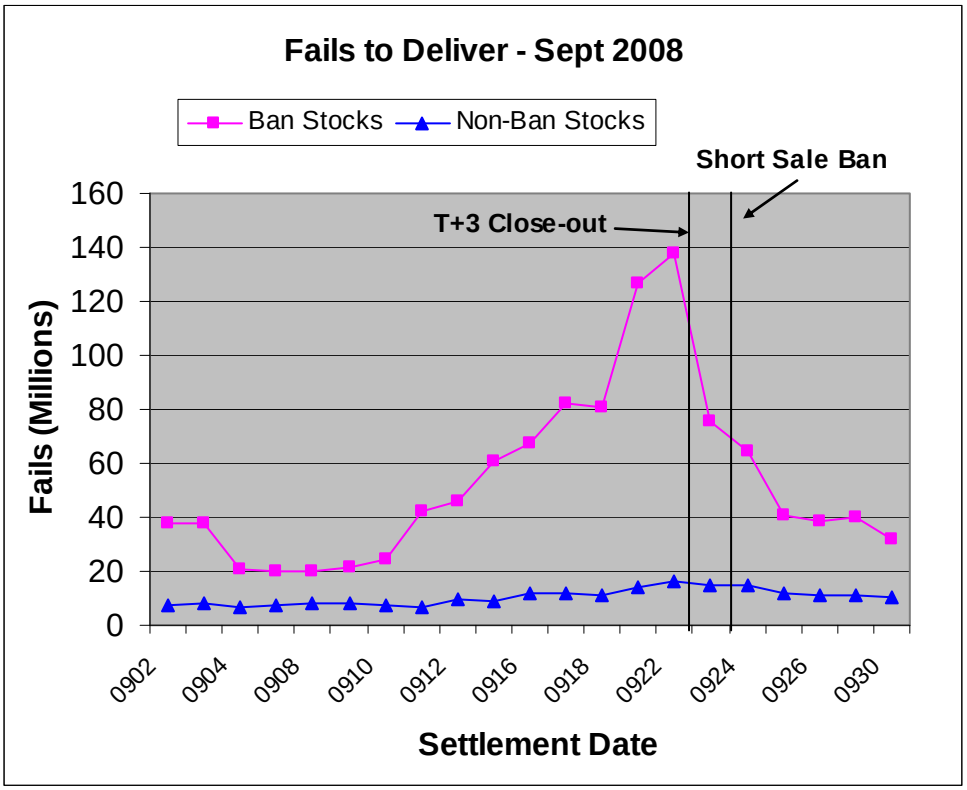

Figure 2

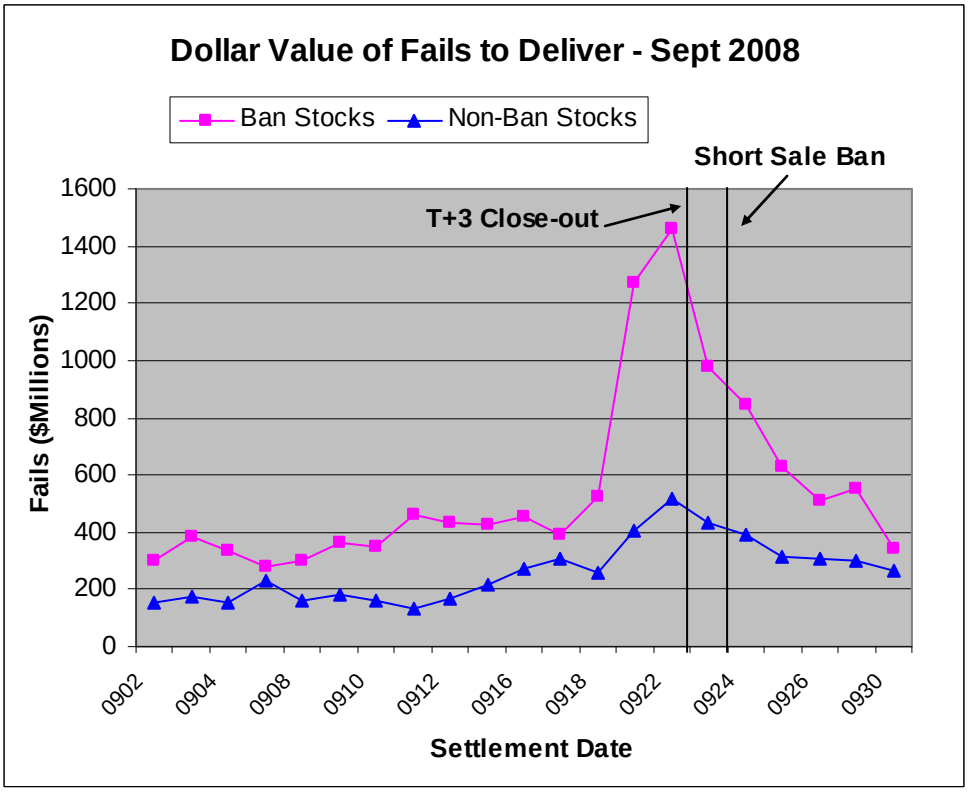

Fails to Deliver in All Stocks

Fails to deliver across all securities increased by about 15.3% from September 22, 2008 to September 30, 2008 (see Figure 3). The dollar value of fails to deliver across all securities declined about 54.4% from September 22, 2008 to September 30, 2008 (see Figure 4). The difference in results from the two measures is due to a number of low priced securities with new fails on September 30, 2008. Excluding all securities with stock price $1.00 or less, fails to deliver decline by 40.1% from September 22, 2008 to September 30, 2008 (see Figure 5).

September 23, 2008 was first settlement date we may see some close-outs from the new T+3 close-out rule if the close-out was through borrowing stock. If close-outs were done through trades on September 23, 2008, we would not see it in settlement data until September 26, 2008. The first trading day of the short sale ban would show up on the September 24, 2008 settlement date. Since the initial impact of T+3 close-out rule and the short sale ban occur at the same time, it is hard to attribute any effect from September 24, 2008 onward to one or the other.

Figure 3

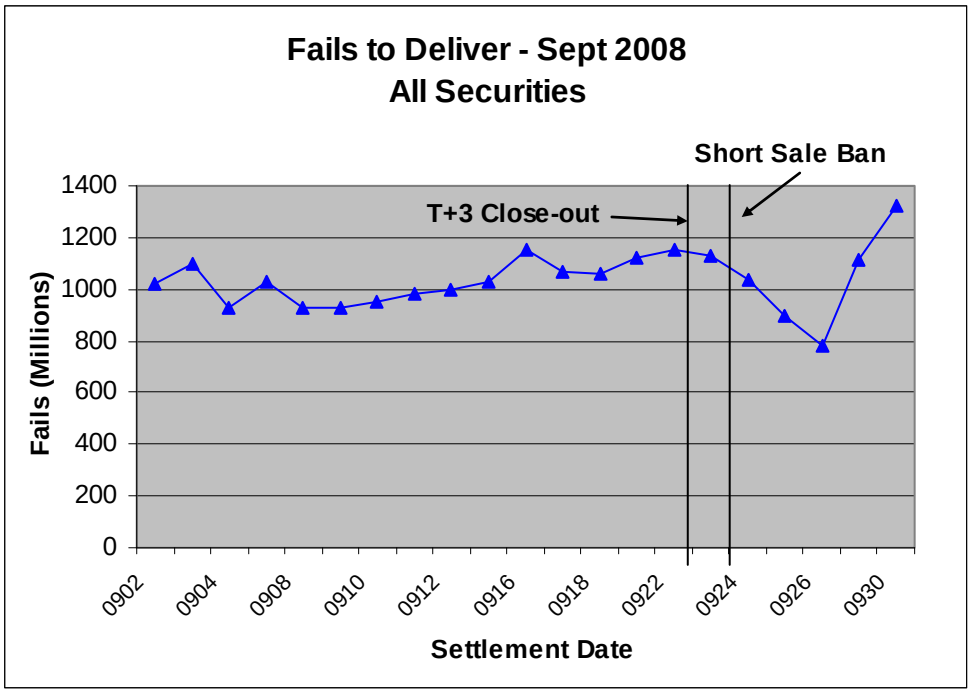

Figure 4

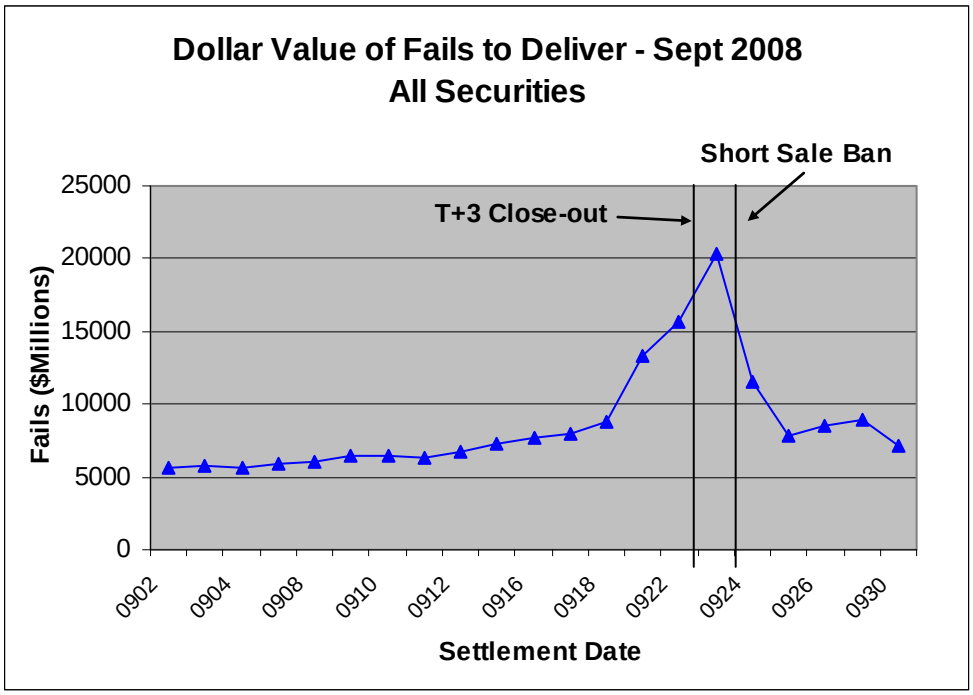

Figure 5

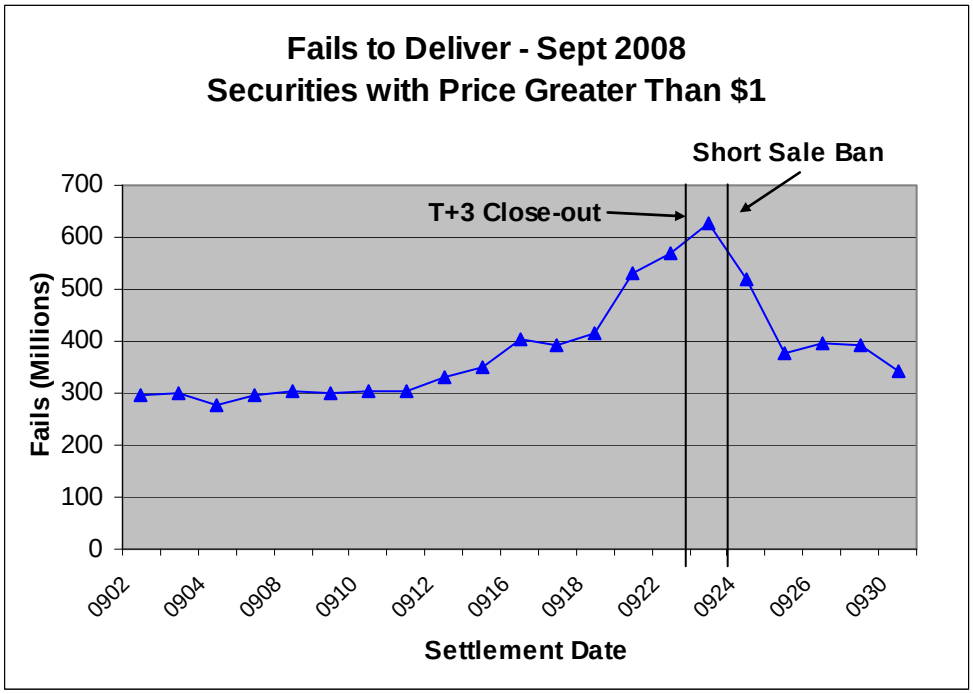

Fails to Deliver in All Short Sale Ban Stocks

Short sale ban stocks showed a dramatic decrease in fails starting on September 24, 2008 (see Figure 6). Fails in short sale ban stocks declined by about 41.7% from September 22, 2008 to September 30, 2008. The dollar value of fails in short sale ban stocks declined by about 73.2% from September 22, 2008 to September 30, 2008 (see Figure 7).

Another noticeable thing about the charts is the run-up in fails prior to the formal release of the new T+3 close-out rule. In particular, there were news reports on September 16th about the forthcoming rules and there is clearly a large increase in fails on corresponding to that trade date (September 19th settlement date). The chart is consistent with the conclusion that traders were failing to deliver, at least in large financial stocks where the threat of short sale restrictions was the greatest, in anticipation of new rules.

September 23, 2008 was first settlement date we may see some close-outs from the new T+3 close-out rule if the close-out was through borrowing stock. If close-outs were done through trades on September 23, 2008, we would not see it in settlement data until September 26, 2008. The first trading day of the short sale ban would show up on the September 24, 2008 settlement date. Since the initial impact of T+3 close-out rule and the short sale ban occur at the same time, it is hard to attribute any effect from September 24, 2008 onward to one or the other.

DATE: November 4, 2009

SUBJECT: Impact of Recent SHO Rule Changes on Fails to Deliver

This memorandum examines fails to deliver before and after the elimination of the options market maker (OMM) exception in Rule 203 of Regulation SHO and the implementation of interim final temporary Rule 204T and permanent Rule 204 (T+3 Close-out Rule). This memo includes three additional months of data and updates results from earlier memos dated March 20, 2009, November 26, 2008, and April 16, 2009. The findings here are consistent with those in the earlier memos.

Due to the contemporaneous implementation of the elimination of the options market maker exception and Rule 204T, they are analyzed together.[1] Since the rule changes significantly shortened the window to close-out most fail to deliver positions and expanded the close-out provisions to all equity securities, we would expect to see a decline in average daily fails due to compliance with the new rules, all else equal. However, it is also possible that certain behavioral changes or other factors could mitigate or exacerbate any effect. For example, faster "cycling" of fails (more rapid fail-closeout-fail-closeout) could lead to full compliance with the new rules but no change in average daily fails.

In summary, the results indicate that fails to deliver decreased significantly after the elimination of the OMM exception and the implementation of the T+3 Close-out Rule. Fails declined by 63.4% across all securities and 80.5% for threshold stocks. In addition, there is some evidence that optionable stocks experienced larger declines than non-optionable stocks. There has been a large downward trend in fails since July 2008.

Background

The Commission approved a final rule to eliminate the options market maker exception from the close-out requirement of Rule 203(b)(3) in Regulation SHO. This rule change became effective at 12:01 a.m. ET on Thursday, Sept. 18, 2008. The Commission made

[1] We also note that Emergency Order (Release No. 34-58592) temporarily prohibited any person from effecting a short sale in the publicly traded securities of certain financial firms during the period from September 19 to October 8, 2008.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

permanent the relevant provisions of Rule 204T, as Rule 204, in July 2009.[2] As a result, any new fails by options market makers after the effective date are subject to the same close-out requirements as other market participants under Rule 204. Interim final temporary Rule 204T provided for a 35-settlement day phase-in period to close-out previously established fail to deliver positions by option market makers. In other words, since the effective date of the SEC Emergency Order (Release No. 34-58572) was September 18, 2008, the phase-in period ended prior to the start of trading on November 7, 2008. Any change in a fail position that is closed-out via a standard settlement trade on November 7, 2008 appeared November 13, 2008.

The Commission also adopted in September 2008, on an interim final basis, a new rule requiring that short sellers and their broker-dealers deliver securities by the close of business on the settlement date (three days after the sale transaction date, or T+3) and imposing penalties for failure to do so. As noted above, this interim final rule was made permanent effective July 31, 2009 with some limited modifications. Rule 204 establishes that fail to deliver positions related to short sales must be closed out prior to the beginning of normal trading hours on the next settlement day following the settlement date of the newly-created fail (usually T+4). Fail to deliver positions related to bona fide market making or long sales have an additional two settlement days to close-out fail to deliver positions (usually T+6). Fail to deliver positions related to sales pursuant to Rule 144 have 36 settlement days to close out (usually T+39). One major distinction between Rule 204 and Rule 203 is that Rule 204 covers all equity securities whereas Rule 203 covers only threshold list securities. Since the close-out provisions of Rule 204 differ depending on the type of trade that led to the fail and the date of the fail, Appendix A provides a summary table that lists important introduction dates for each category.

Since some previously-established fails in threshold list securities may have had up to 14 days to close-out, a large part of the effect of the new close-out requirements may not have shown up in the NSCC settlement data until October 10, 2008 (17 settlement days after the day prior to the effective date). Also, since some previously-established OMM fails had up to 36 days to close-out, the full effect of the new close-out requirements in optionable securities may not have shown up in the NSCC settlement data until November 13, 2008 (39 settlement days after the effective date). Also, pre-existing fails in non-threshold stocks were not required to be closed-out within any time period unless the security entered the threshold list. Since we do not want our analysis confounded by the grandfather exception elimination, we use the period from January 1, 2008 to September 22, 2008 (183 days) as the pre-Rule period.[3] The period from September 23, 2008 to September 30, 2009 (256 days) is defined as the post-Rule period.

[2] See Exchange Act Release No. 60388 (July 29, 2009, 74 FR 38266 (July 31, 2009); http://www.sec.gov/rules/final/2009/34-60388fr.pdf and http://www.sec.gov/rules/final/2009/34-60388.pdf.

[3] We note that the pre-period includes the period of the July Emergency Order that temporarily required pre-borrowing for the securities of publicly traded securities of 19 substantial financial firms prior to short sales (Release No. 34-58166). The July Emergency Order led to a significant reduction in fails in these securities. The length of the pre-period window and the small number of securities affected by the July

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

All Securities (Table 1):

Table 1 shows the average daily fail to deliver measures pre- and post-Rule 204 and OMM exception elimination for all securities. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily fails to deliver shares decreased by 63.4%.
- The average daily dollar value of fails to deliver decreased by 77.5%.
- The average daily number of fails to deliver positions decreased by 60.3%.

Threshold List Securities (Table 2):

Table 2 shows the summary fail to deliver measures for threshold list securities. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of threshold list securities decreased by 82.1%.
- The average daily fails to deliver shares in threshold securities decreased by 80.5%.
- The average daily dollar value of fails to deliver in threshold securities decreased by 92.5%.
- The average daily number of fails to deliver positions in threshold securities decreased by 89.7%.

Threshold List Securities with Listed Options (Table 3):

Table 3 shows the summary fail to deliver measures for threshold list securities with listed options. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of optionable threshold list securities decreased by 88.8%.
- The average daily fails to deliver shares in optionable threshold securities decreased by 90.9%.
- The average daily dollar value of fails to deliver in optionable threshold securities decreased by 93.5%.
- The average daily number of fails to deliver positions in optionable threshold securities decreased by 92.6%.

Threshold List Securities without Listed Options (Table 4):

Table 4 shows the summary fail to deliver measures for threshold list securities without listed options. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of non-optionable threshold list securities decreased by 76.2%.
- The average daily fails to deliver shares in non-optionable threshold securities decreased by 75.9%.

Emergency Order largely mitigate any confounding influence from this inclusion. Further, any bias would be in the direction of finding a smaller impact from the September 2008 rule changes.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

- The average daily dollar value of fails to deliver in non-optionable threshold securities decreased by 83.3%.
- The average daily number of fails to deliver positions in non-optionable threshold securities decreased by 84.4%.

Any difference in the change in fails between stocks with listed options (Table 3) and threshold stocks without listed options (Table 4) may indicate the impact of the elimination of the option market making exception. The comparison indicates that stocks with listed options saw larger percentage decreases than stocks without options. Depending on the measure, the declines are 7.8% to 21.3% larger for stocks with listed options.

Daily Fails to Deliver in All Securities (Figure 1):

Figure 1 shows the daily aggregate fails in all securities from April 1, 2004 to September 30, 2009. There has been a decline of 88.5% from the 2008 high of 2.21 billion shares on July 16, 2008 to 0.25 billion shares on June 30, 2009. There was a large spike to 2.33 billion shares on June 19, 2009 and 2.36 billion shares on June 22, 2009 that was the result of a two-day, 2 billion share fail to deliver in one stock, eWorld Companies Inc. (EWRC). It is important to note that we do not attempt to adjust fails to deliver for increases in trading volume over time. Assuming everything else constant, as the magnitude of trading (settlements) increases one would expect that the magnitude of fails to deliver would also increase. From April 1, 2004 to December 31, 2004 (Pre-Rule 203), the average daily fails were 810 million shares. From January 1, 2009 to September 30, 2009, the average daily fails were 402 million shares, a decrease of 50.4%. During the same period, the average monthly dollar value of trading increased 117.7% from $2.3 trillion to $5.0 trillion.[4] Therefore, fails have decreased despite greater trading activity.

Average Daily Number of Threshold List Securities (Figure 2):

Figure 2 shows the average daily number of threshold list securities for each month from January 2005 to September 2009. The average in September 2009 was 59.6 securities per day, a decline of 88.2% from its high in July 2008.

Daily Number of Threshold List Securities (Figure 3):

Figure 3 shows the daily number of threshold list securities from January 7, 2005 to September 30, 2009. There has been a decline of 90.3% from the high of 632 on July 14, 2008 to 61 on September 30, 2009.

Daily Fails to Deliver in Threshold List Securities (Figure 4):

Figure 4 shows the daily aggregate fails in threshold list securities from January 7, 2005 to September 30, 2009. There has been a decline of 97.4% from the high of 1.36 billion shares on July 16, 2008 to 0.04 billion shares on September 30, 2009.

[4] The numbers are based on an aggregation of monthly Form R31 reports filed by SROs and exchanges.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

Daily Fails to Deliver in All Securities (Figure 5):
Figure 5 shows the daily aggregate fails in all securities from June 2, 2008 to September 30, 2009. There was a large spike to 2.33 billion shares on June 19, 2009 and 2.36 billion shares on June 22, 2009 that was the result of a two-day, 2 billion share fail to deliver in one stock, eWorld Companies Inc. (EWRC). The chart denotes the effective date of the T+3 Close-out Rule.

Daily Number of Threshold List Securities (Figure 6):
Figure 6 shows the daily number of threshold list securities from June 2, 2008 to September 30, 2009.

Daily Fails to Deliver in Threshold List Securities (Figure 7):
Figure 7 shows the daily aggregate fails in threshold list securities from June 2, 2008 to September 30, 2009.

ETPs as a Proportion of All Threshold List Securities (Figure 8):
Figure 8 shows the daily number of threshold list securities and Exchange Traded Products (ETPs) as a proportion of all threshold list securities from January 2, 2008 to September 30, 2009. Post-Rule, ETPs have become a more significant portion of threshold list securities and on some days accounted for more than 50% of all threshold list securities.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

SUBJECT: Impact of Recent SHO Rule Changes on Fails to Deliver

This memorandum examines fails to deliver before and after the elimination of the options market maker (OMM) exception in Rule 203 of Regulation SHO and the implementation of interim final temporary Rule 204T (T+3 Close-out Rule). This memo includes two additional months of data and updates results from an earlier memo dated November 26, 2008. The findings here are consistent with those in the earlier memo. In general, the current memo shows much larger declines in fails measures than the earlier memo.

Due to the contemporaneous implementation of these two rules, they are analyzed together.[1] Since the rule changes significantly shortened the window to close-out most fail to deliver positions and expanded the close-out provisions to all equity securities, we would expect to see a decline in average daily fails due to compliance with the new rules, all else equal. However, it is also possible that certain behavioral changes or other factors could mitigate or exacerbate any effect. For example, faster "cycling" of fails (more rapid fail-closeout-fail-closeout) could lead to full compliance with the new rules but no change in average daily fails.

In summary, the results indicate that fails to deliver decreased significantly after the elimination of the OMM exception and the implementation of the T+3 Close-out Rule. Fails declined by 47.2% across all securities and 63.0% for threshold stocks. In addition, there is some evidence that optionable stocks experienced larger declines than non-optionable stocks. There has been a large downward trend in fails since July 2008.

Background

The Commission approved a final rule to eliminate the options market maker exception from the close-out requirement of Rule 203(b)(3) in Regulation SHO. This rule change also becomes effective at 12:01 a.m. ET on Thursday, Sept. 18, 2008. As a result, any new fails by options market makers after the effective date are subject to the same close-out requirements as other market participants under Rule 204T. The rule change also

[1] We also note that Emergency Order (Release No. 34-58592) temporarily prohibited any person from effecting a short sale in the publicly traded securities of certain financial firms during the period from September 19 to October 8, 2008.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

provides for a 35-settlement day phase-in period to close-out previously established fail to deliver positions by option market makers. In other words, since the effective date of the SEC Emergency Order (Release No. 34-58572) was September 18, 2008, the phase-in period ends prior to the start of trading on November 7, 2008. Any change in a fail position that is closed-out via a standard settlement trade on November 7, 2008 will appear on November 13, 2008.

The Commission also adopted, on an interim final basis, a new rule requiring that short sellers and their broker-dealers deliver securities by the close of business on the settlement date (three days after the sale transaction date, or T+3) and imposing penalties for failure to do so. Rule 204T establishes that fail to deliver positions related to short sales must be closed out prior to the beginning of normal trading hours on the next settlement day following the settlement date of the newly-created fail (usually T+4). Fail to deliver positions related to bona fide market making or long sales have an 2 additional settlement days to close-out fail to deliver positions (usually T+6). Fail to deliver positions related to sales pursuant to Rule 144 have 36 settlement days to close out (usually T+39). One major distinction between Rule 204T and Rule 203 is that Rule 204T covers all equity securities whereas Rule 203 covers only threshold list securities. Since the close-out provisions of Rule 204T differ depending on the type of trade that led to the fail and the date the fail, Appendix A provides a summary table that lists important introduction dates for each category.

Since some previously-established fails in threshold list securities may have up to 14 days to close-out, a large part of the effect of the new close-out requirements may not show up in the NSCC settlement data until October 10, 2008 (17 settlement days after the day prior to the effective date). Also, since some previously-established OMM fails have up to 36 days to close-out, the full effect of the new close-out requirements in optionable securities may not show up in the NSCC settlement data until November 13, 2008 (39 settlement days after the effective date). Also, pre-existing fails in non-threshold stocks are not required to be closed-out within any time period unless the security enters the threshold list. Since we do not want our analysis confounded by the grandfather exception elimination, we use the period from January 1, 2008 to September 22, 2008 (183 days) as the pre-Rule period.[2] The period from September 23, 2008 to December 31, 2008 (68 days) is defined as the post-Rule period.

All Securities (Table 1):

[2] We note that the pre-period includes the period of the July Emergency Order that temporarily required pre-borrowing for the securities of publicly traded securities of 19 substantial financial firms prior to short sales (Release No. 34-58166). The July Emergency Order led to a significant reduction in fails in these securities. The length of the pre-period window and the small number of securities affected by the July Emergency Order largely mitigate any confounding influence from this inclusion. Further, any bias would be in the direction of finding a smaller impact from the September 2008 rule changes.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

Table 1 shows the average daily fail to deliver measures pre- and post-Rule 204T and OMM exception elimination for all securities. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily fails to deliver shares decreased by 47.2%.
- The average daily dollar value of fails to deliver decreased by 64.8%.
- The average daily number of fails to deliver positions decreased by 54.3%.

Threshold List Securities (Table 2):

Table 2 shows the summary fail to deliver measures for threshold list securities. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of threshold list securities decreased by 69.2%.
- The average daily fails to deliver shares in threshold securities decreased by 63.0%.
- The average daily dollar value of fails to deliver in threshold securities decreased by 81.2%.
- The average daily number of fails to deliver positions in threshold securities decreased by 78.9%.

Threshold List Securities with Listed Options (Table 3):

Table 3 shows the summary fail to deliver measures for threshold list securities with listed options. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of optionable threshold list securities decreased by 72.3%.
- The average daily fails to deliver shares in optionable threshold securities decreased by 77.2%.
- The average daily dollar value of fails to deliver in optionable threshold securities decreased by 82.4%.
- The average daily number of fails to deliver positions in optionable threshold securities decreased by 80.5%.

Threshold List Securities without Listed Options (Table 4):

Table 4 shows the summary fail to deliver measures for threshold list securities without listed options. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of non-optionable threshold list securities decreased by 66.4%.
- The average daily fails to deliver shares in non-optionable threshold securities decreased by 56.6%.
- The average daily dollar value of fails to deliver in non-optionable threshold securities decreased by 71.3%.
- The average daily number of fails to deliver positions in non-optionable threshold securities decreased by 75.8%.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

Any difference in the change in fails between stocks with listed options (Table 3) and threshold stock without listed options (Table 4) may indicate the impact of the elimination of the option market making exception. The comparison indicates that stocks with listed options saw larger percentage decreases than stocks without options. Depending on the measure, the declines are 2.7% to 28.8% larger for stocks with listed options.

Daily Fails to Deliver in All Securities (Figure 1):

Figure 1 shows the daily aggregate fails in all securities from April 1, 2004 to December 31, 2008. There has been a decline of 85.7% from the 2008 high of 2.21 billion shares on July 16, 2008 to 0.32 billion shares on December 31, 2008. It is important to note that we do not attempt to adjust fails to deliver for increases in trading volume over time. Assuming everything else constant, as the magnitude of trading (settlements) increases one would expect that the magnitude of fails to deliver would also increase. From April 1, 2004 to December 31, 2004 (Pre-Rule 203), the average daily fails were 810 million shares. From January 1, 2008 to December 31, 2008, the average daily fails were 962 million shares, an increase of about 18.8%. During the same periods, the average monthly dollar value of trading increased 203.8% from $2.3 trillion to $7.0 trillion.[3] Therefore, fails have increased since 2004 at a much slower rate than trading volume.

Average Daily Number of Threshold List Securities (Figure 2):

Figure 2 shows the average daily number of threshold list securities for each month from January 2005 to December 2008. The average in December 2008 was 83.9 securities per day, a decline of 83.3% from its high in July 2008.

Daily Number of Threshold List Securities (Figure 3):

Figure 3 shows the daily number of threshold list securities from January 7, 2005 to December 31, 2008. There has been a decline of 80.2% from the high of 622 on July 17, 2008 to 123 on December 31, 2008.

Daily Fails to Deliver in Threshold List Securities (Figure 4):

Figure 4 shows the daily aggregate fails in threshold list securities from January 7, 2005 to December 31, 2008. There has been a decline of 91.7% from the high of 1.36 billion shares on July 16, 2008 to 0.11 billion shares on December 31, 2008.

Daily Fails to Deliver in All Securities (Figure 5):

Figure 5 shows the daily aggregate fails in all securities from June 2, 2008 to December 31, 2008. The chart denotes the settlement period where the temporary emergency order requiring pre-borrowing for short sales was in effect for 19 substantial financial firms. The chart also denotes the settlement period where the temporary emergency order

[3] The numbers are based on an aggregation of monthly Form R31 reports filed by SROs and exchanges. At the time of this analysis, Form R31 reports were not available for December 2008.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

banning short sales in about 800 securities was effective. Lastly, the chart denotes the first settlement date where the effect of Rule 204T would appear.

Daily Number of Threshold List Securities (Figure 6):
Figure 6 shows the daily number of threshold list securities from June 2, 2008 to December 31, 2008.

Daily Fails to Deliver in Threshold List Securities (Figure 7):
Figure 7 shows the daily aggregate fails in threshold list securities from June 2, 2008 to December 31, 2008.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

DATE: April 16, 2009

SUBJECT: Impact of Recent SHO Rule Changes on Fails to Deliver

This memorandum examines fails to deliver before and after the elimination of the options market maker (OMM) exception in Rule 203 of Regulation SHO and the implementation of interim final temporary Rule 204T (T+3 Close-out Rule). This memo includes three additional months of data and updates results from earlier memos dated March 20, 2009 and November 26, 2008. The findings here are consistent with those in the earlier memos. In general, the current memo shows much larger declines in fails measures than the earlier memos.

Due to the contemporaneous implementation of these two rules, they are analyzed together.[1] Since the rule changes significantly shortened the window to close-out most fail to deliver positions and expanded the close-out provisions to all equity securities, we would expect to see a decline in average daily fails due to compliance with the new rules, all else equal. However, it is also possible that certain behavioral changes or other factors could mitigate or exacerbate any effect. For example, faster "cycling" of fails (more rapid fail-closeout-fail-closeout) could lead to full compliance with the new rules but no change in average daily fails.

In summary, the results indicate that fails to deliver decreased significantly after the elimination of the OMM exception and the implementation of the T+3 Close-out Rule. Fails declined by 56.6% across all securities and 73.5% for threshold stocks. In addition, there is some evidence that optionable stocks experienced larger declines than non-optionable stocks. There has been a large downward trend in fails since July 2008.

Background

The Commission approved a final rule to eliminate the options market maker exception from the close-out requirement of Rule 203(b)(3) in Regulation SHO. This rule change became effective at 12:01 a.m. ET on Thursday, Sept. 18, 2008. As a result, any new fails by options market makers after the effective date are subject to the same close-out requirements as other market participants under Rule 204T. The rule change also

[1] We also note that Emergency Order (Release No. 34-58592) temporarily prohibited any person from effecting a short sale in the publicly traded securities of certain financial firms during the period from September 19 to October 8, 2008.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

provides for a 35-settlement day phase-in period to close-out previously established fail to deliver positions by option market makers. In other words, since the effective date of the SEC Emergency Order (Release No. 34-58572) was September 18, 2008, the phase-in period ended prior to the start of trading on November 7, 2008. Any change in a fail position that is closed-out via a standard settlement trade on November 7, 2008 appeared November 13, 2008.

The Commission also adopted, on an interim final basis, a new rule requiring that short sellers and their broker-dealers deliver securities by the close of business on the settlement date (three days after the sale transaction date, or T+3) and imposing penalties for failure to do so. Rule 204T establishes that fail to deliver positions related to short sales must be closed out prior to the beginning of normal trading hours on the next settlement day following the settlement date of the newly-created fail (usually T+4). Fail to deliver positions related to bona fide market making or long sales have an additional two settlement days to close-out fail to deliver positions (usually T+6). Fail to deliver positions related to sales pursuant to Rule 144 have 36 settlement days to close out (usually T+39). One major distinction between Rule 204T and Rule 203 is that Rule 204T covers all equity securities whereas Rule 203 covers only threshold list securities. Since the close-out provisions of Rule 204T differ depending on the type of trade that led to the fail and the date the fail, Appendix A provides a summary table that lists important introduction dates for each category.

Since some previously-established fails in threshold list securities may have had up to 14 days to close-out, a large part of the effect of the new close-out requirements may not show up in the NSCC settlement data until October 10, 2008 (17 settlement days after the day prior to the effective date). Also, since some previously-established OMM fails have up to 36 days to close-out, the full effect of the new close-out requirements in optionable securities may not show up in the NSCC settlement data until November 13, 2008 (39 settlement days after the effective date). Also, pre-existing fails in non-threshold stocks are not required to be closed-out within any time period unless the security enters the threshold list. Since we do not want our analysis confounded by the grandfather exception elimination, we use the period from January 1, 2008 to September 22, 2008 (183 days) as the pre-Rule period.[2] The period from September 23, 2008 to March 31, 2009 (129 days) is defined as the post-Rule period.

[2] We note that the pre-period includes the period of the July Emergency Order that temporarily required pre-borrowing for the securities of publicly traded securities of 19 substantial financial firms prior to short sales (Release No. 34-58166). The July Emergency Order led to a significant reduction in fails in these securities. The length of the pre-period window and the small number of securities affected by the July Emergency Order largely mitigate any confounding influence from this inclusion. Further, any bias would be in the direction of finding a smaller impact from the September 2008 rule changes.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

All Securities (Table 1):

Table 1 shows the average daily fail to deliver measures pre- and post-Rule 204T and OMM exception elimination for all securities. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily fails to deliver shares decreased by 56.6%.
- The average daily dollar value of fails to deliver decreased by 74.8%.
- The average daily number of fails to deliver positions decreased by 58.5%.

Threshold List Securities (Table 2):

Table 2 shows the summary fail to deliver measures for threshold list securities. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of threshold list securities decreased by 77.5%.
- The average daily fails to deliver shares in threshold securities decreased by 73.5%.
- The average daily dollar value of fails to deliver in threshold securities decreased by 89.0%.
- The average daily number of fails to deliver positions in threshold securities decreased by 86.3%.

Threshold List Securities with Listed Options (Table 3):

Table 3 shows the summary fail to deliver measures for threshold list securities with listed options. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of optionable threshold list securities decreased by 82.1%.
- The average daily fails to deliver shares in optionable threshold securities decreased by 86.9%.
- The average daily dollar value of fails to deliver in optionable threshold securities decreased by 89.8%.
- The average daily number of fails to deliver positions in optionable threshold securities decreased by 88.2%.

Threshold List Securities without Listed Options (Table 4):

Table 4 shows the summary fail to deliver measures for threshold list securities without listed options. The evidence shows significant declines in all fails to deliver measures. For example:

- The average daily number of non-optionable threshold list securities decreased by 73.4%.
- The average daily fails to deliver shares in non-optionable threshold securities decreased by 67.4%.
- The average daily dollar value of fails to deliver in non-optionable threshold securities decreased by 82.4%.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

- The average daily number of fails to deliver positions in non-optionable threshold securities decreased by 82.9%.

Any difference in the change in fails between stocks with listed options (Table 3) and threshold stock without listed options (Table 4) may indicate the impact of the elimination of the option market making exception. The comparison indicates that stocks with listed options saw larger percentage decreases than stocks without options. Depending on the measure, the declines are 5.3% to 25.7% larger for stocks with listed options.

Daily Fails to Deliver in All Securities (Figure 1):

Figure 1 shows the daily aggregate fails in all securities from April 1, 2004 to March 31, 2009. There has been a decline of 80.6% from the 2008 high of 2.21 billion shares on July 16, 2008 to 0.43 billion shares on March 31, 2009. It is important to note that we do not attempt to adjust fails to deliver for increases in trading volume over time. Assuming everything else constant, as the magnitude of trading (settlements) increases one would expect that the magnitude of fails to deliver would also increase. From April 1, 2004 to December 31, 2004 (Pre-Rule 203), the average daily fails were 810 million shares. From January 1, 2009 to March 31, 2009, the average daily fails were 363 million shares, a decrease of 55.2%. During the same periods, the average monthly dollar value of trading increased 130.4% from $2.3 trillion to $5.3 trillion.[3] Therefore, fails have decreased despite greater trading activity.

Average Daily Number of Threshold List Securities (Figure 2):

Figure 2 shows the average daily number of threshold list securities for each month from January 2005 to March 2009. The average in March 2009 was 63.2 securities per day, a decline of 87.4% from its high in July 2008.

Daily Number of Threshold List Securities (Figure 3):

Figure 3 shows the daily number of threshold list securities from January 7, 2005 to March 31, 2009. There has been a decline of 88.3% from the high of 632 on July 14, 2008 to 74 on March 31, 2009.

Daily Fails to Deliver in Threshold List Securities (Figure 4):

Figure 4 shows the daily aggregate fails in threshold list securities from January 7, 2005 to March 31, 2009. There has been a decline of 83.0% from the high of 1.36 billion shares on July 16, 2008 to 0.23 billion shares on March 31, 2009.

[3] The numbers are based on an aggregation of monthly Form R31 reports filed by SROs and exchanges.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

Daily Fails to Deliver in All Securities (Figure 5):

Figure 5 shows the daily aggregate fails in all securities from June 2, 2008 to March 31, 2009. The chart denotes the settlement period where the temporary emergency order requiring pre-borrowing for short sales was in effect for 19 substantial financial firms. The chart also denotes the settlement period where the temporary emergency order banning short sales in about 800 securities was effective. Lastly, the chart denotes the effective date of Rule 204T.

Daily Number of Threshold List Securities (Figure 6):

Figure 6 shows the daily number of threshold list securities from June 2, 2008 to March 31, 2009.

Daily Fails to Deliver in Threshold List Securities (Figure 7):

Figure 7 shows the daily aggregate fails in threshold list securities from June 2, 2008 to March 31, 2009.

ETPs as a Proportion of All Threshold List Securities (Figure 8):

Figure 8 shows the daily number of threshold list securities and Exchange Traded Products (ETPs) as a proportion of all threshold list securities from January 2, 2008 to March 31, 2009. Post-Rule, ETPs have become a more significant portion of threshold list securities and on some days accounted for more than 50% of all threshold list securities.

This is a memo of the staff of the Office of Economic Analysis. The Commission has expressed no view regarding the analysis, findings or conclusions herein.

Table 1
Summary Statistics on Fails to Deliver
All Securities
Pre- and Post-Rule

Measure	Pre	Post	Change	Percent Change
Number of Days	183	129		
Average Daily Dollar Value of Aggregate Fails ($millions)	7,775	1,959	**-5,815**	-74.8%

Appendix A
Fail to Deliver Close-out Requirements of Rule 204T
Important Dates to Measure Impact

Fail Category	Settlement Days to Close-out Fail: Threshold Stocks	Settlement Days to Close-out Fail: Other Stocks	Last Trade Date to Close-out	Settlement Date Associated with Last Close-out Date
Pre-existing on September 17, 2008				
Not Option Market Maker	14 (or less)	None	October 7, 2008	October 10, 2008
Option Market Maker (OMM)	36	None	November 7, 2008	November 13, 2008
New fails on September 18, 2008				
OMM, MM, and long sales	3	3	September 23, 2008	September 26, 2008
Short sales (generally non-MM)	1	1	September 18, 2008	September 23, 2008
Rule 144 sales*	36	36	November 10, 2008	November 14, 2008

Note that the close-out aging begins on September 17, 2008 for pre-existing fails whereas it begins on September 18, 2008 for new fails.
* The longer time window did not initially apply to certain ESOP sales and certain sales associated with shelf offerings. However, the longer time window is applicable for these sales effective October 17, 2008.

OFFICE OF ECONOMIC ANALYSIS
DRAFT MEMORANDUM

To: Distribution List
From: Office of Economic Analysis
Date: PRELIMINARY DRAFT: October 8, 2008
Re: Empirical evidence on the short selling ban and other related issues

---

OEA is monitoring a number of different variables to determine the effect of the short selling ban that went into effect on September 19, 2008, and of the other recent emergency orders. We are examining various measures that we suspected would be impacted by the ban and the other emergency orders, and followed up on a few of the anecdotes swirling following the short selling ban. In addition, we have reviewed statistics provided to us by Nasdaq OMX Economic and Statistical Research and by Citadel Investment Group relating to the effects of the ban. At this stage, our analysis and conclusions are still preliminary. We will continue to update and refine our analysis going forward.

This memo briefly summarizes some of the key findings to date. In interpreting these results, it is vital to recognize that under the current crisis conditions, many other factors other than the Emergency Orders may be influencing the market for financial stocks. Observed differences between financial stocks and non-financial stocks may be driven by these other factors. We are still working to refine our analysis to see if we can isolate the effects of the Emergency Orders from other factors.

Stock Liquidity

Nasdaq finds that quoted spreads increased significantly for financial stocks subject to the ban when the Emergency Orders went into effect on September 19. For example, Nasdaq Best Bid Offer spreads on financial stocks increased from 33 basis points for the period September 15-17 to 47 basis points for the period September 22-25, an increase of more than 45%. Nasdaq also reports that quoted depth for financial stocks decreased 42% over the same period. Citadel reports similar findings. OEA is in the process of verifying these numbers, and should have preliminary results by early next week. For more liquidity results, please refer to the PowerPoint slides provided by Nasdaq.

Volatility and Volume

We have heard anecdotally that stock volume has dried up as a result of the short selling ban while volatility has increased. In a well functioning market, volume has a tendency to increase as volatility increases, so such a result would indicate that the markets are not functioning well under a short selling ban.

- Overall market volatility rose sharply in September and continued to rise after the short selling ban. This result is observed in the form of higher realized volatility for market

SEC_OEA_FCIC_001150

indices, and also in increased implied volatility of S&P 500 options. During the ban, overall market volume fell as overall market volatility continued to rise.

- Trading volume in individual stocks increased in the first few weeks of September for all stocks, and especially in financial stocks. The ban resulted in a larger drop in volume for the banned stocks than the non-banned stocks, but volume levels were more in line with early September levels than with what we might interpret as a "dried up" market.

- Preliminary results indicate that trading volume in options experienced a similar pattern, though the options volume, particularly the put option volume, started to decline prior to the emergency orders.

- Individual stock volatility rose in the first few weeks of September, peaking on the day prior to the short selling ban. Following the ban, individual stock volatility fell somewhat, but remained fairly high.

- Implied volatilities in individual options of banned stocks do not show patterns that are easy to interpret, but appear to have either increased or remained constant following the short selling ban.

- Together with the overall stock volatility results, the individual volatility results suggest that the stock returns of individual stocks are more correlated with each other. This can be interpreted as a loss of market efficiency.

- The cross-sectional correlation between volume and volatility for individual stocks with banned short selling is positive prior to the short selling ban, negative on the first day of the ban, and positive again afterward. A closer look at the first day shows that the intraday volume-volatility correlation is statistically negative for stocks in the short selling ban and statistically positive for stocks that were not in the ban. This indicates that the markets functioned poorly without short selling on the first day of the ban.

Equity Lending

Economic theory as well as anecdotal evidence suggests that both the short selling ban and the T+3 Emergency Order may have impacted the equity lending market. It is somewhat difficult to disentangle the effects of the two orders.

- There appears to be no difference in the median rebate rate for financial and non-financial stocks. However, the mean rebate for banned stocks appears to have decreased by about 50 basis points relative to non-banned stocks when the Orders went into effect. Because the difference is observed in the mean but not the median, this suggests that the ban is associated with sharply increased lending rates for a minority of stocks.

- We are undertaking analysis to determine whether the Emergency Orders are associated with changes in the level of lending rates, but have not yet completed this analysis.

Failures to Deliver

SEC_OEA_FCIC_001151

Complaints about naked short selling continue to circulate. While not all failures to deliver are associated with naked short selling, OEA monitors failures as a means of trying to detect possible naked short selling.

- Failures to deliver in all securities, and especially in financial stocks, rose significantly in the weeks leading up to the short selling ban.

- Failures to deliver declined when the T+3 and Option Market Maker emergency orders became effective and continued declining through the end of the month. The decline was greater for the financial stocks, which were subject to the ban.

- Despite the T+3 emergency order, some stocks, especially small stocks still experienced large new failures to deliver.

Arbitrage Strategies

Several industry participants have complained that the short selling ban makes adjusting arbitrage positions difficult. This could result in a divergence of values that sends arbitrageurs rushing for cash to make margins or to the exit of arbitrageurs from the market.

- The convertible bond market has suffered as a result of the ban. We understand that convertible arbitrage accounts for a substantial proportion of the short interest in stocks that issue convertible bonds (perhaps as large as 40%) so the inability for bondholders to hedge harms issuers of convertible bonds significantly. The President and CEO of a large high-tech company complained that "the recent SEC action has completely shut down convertible debentures as a source of funding for the high-tech industry."

- While some examples may differ, we find no predictable pattern suggesting that the short selling ban resulted in a divergence in values adversely affecting merger arbitrage positions.

Option Spreads

Option market makers hedge their risk by short selling the underlying stock. At the beginning of the ban, option market makers did not have an exemption to hedge their market making positions. The inability to hedge increases the risks of market making, forcing option market makers to offset potential losses with larger bid-ask spreads. In addition, the T+3 emergency order and the removal of the option market maker exception to delivery requirements can also raise the costs of option market makers, and those increased costs could get passed on to investors in the form of higher spreads.

- Preliminary analysis indicates that option spreads increased substantially for stocks subject to the short selling ban as well as stocks that were not subject to the short selling ban, though

SEC_OEA_FCIC_001152

the change was more severe for the stocks subject to the ban. OEA is still working on this analysis

Other Results

OEA has requested data on short selling transactions from several exchanges. Data from September 1 to September 19 is just starting to arrive. Among other questions, we plan to use this data to examine the role of short selling in the events leading up to the emergency orders. However, we have other new results that help us better understand whether short selling is reasonably responsible for making the credit crisis more severe.

- Examining the short interest of various types of financial firms since the beginning of 2007 reveals that the short interest in certain types of financial stocks that should be more susceptible to the credit crisis started increasing in February 2007, when the VIX index jumped for the first time, or earlier. The upward trend is more pronounced for banks, broker-dealers and investment advisors, and credit institutions than for other financial firms. Credit institutions have particularly high short interest early in 2007.

- The removal of 10a-1 (aka the uptick rule, tick test, or bid test) does not appear to affect the trend toward higher short interest.

- Prior independent research using data at least several years old documents that short selling tends to be positively correlated with contemporaneous returns. In other words, during normal market conditions there is more short selling when stock prices are going up than when prices are going down. Using data on daily short selling volume for 96 stocks from June 12, 2008 to August 12, 2008, we find similar results. However, financial stocks appear different from non-financial stocks. In particular, non-financial stocks display the positive correlation while financial stocks do not. Financial stocks have negative correlation, meaning that they have more short selling when prices are declining, but the correlation is very small and not statistically different from zero.

OEA DRAFT – INTERNAL

OFFICE OF ECONOMIC ANALYSIS
DRAFT MEMORANDUM

To: Distribution List

From: Office of Economic Analysis

Date: September 25, 2008

Re: Short Sale Emergency Orders

This memo summarizes OEA's analysis of various policy alternatives available to the Commission as it approaches the expiration of current Emergency Orders. It also provides information we have been gathering from industry participants relating to the effects of the Emergency Orders banning short selling, requiring institutions to publicly disclose changes in short positions, and imposing a hard T+3 delivery requirement.

The Commission is faced with the Herculean task of making consequential decisions within an extremely limited timeframe as to how to exit from the short sale ban and whether to replace it with new rules. Because short selling rules can have a large economic impact on market participants, OEA believes it is of critical importance that the Commission carefully considers the long-term economic implications of alternative rules proposed to replace the short-sale ban. We recommend that the Commission defer finalizing new rules until it has had time to adequately consider the vast amount of empirical evidence and prior public comment on short selling regulation.

Our recommendations are as follows:

(1) The short selling ban appears to be creating significant distortions and disruptions in business activities across the spectrum of financial market participants. In our view, these distortions are likely to persist or get worse the longer the ban is in place. We recommend that the ban should be removed as quickly as is expeditiously possible.

(2) If the Commission fears that removing the ban abruptly might create a sudden rush of short selling large enough to create further panic, an alternative to a sudden transition would be phase in short selling through a sliding position limit. This would be a temporary rule for a short period such as 10 days after the ban is lifted. For example, the rule might state that no entity would be allowed to increase their short position by more than 0.0025 (one fourth of one percent) of shares outstanding per day. A more aggressive rule might limit new short positions to one tenth of one percent per day. Responsibility of compliance to the rule would be placed on prime brokers and other brokers maintaining customer accounts, so this should require no new systems programming at the exchanges.

Deleted: 9/26/2008

SEC_OEA_FCIC_001156

(3) With respect to the Emergency Order requiring T+3 delivery, we believe this rule has also had unintended negative consequences for some market participants. If the Commission chooses to extend the rule on an interim final basis, we recommend that the Commission aggressively seek comment from market participants such as mutual funds, the securities lending industry, option market makers, and pink sheet market makers to assess how this rule is affecting them.

(4) We recommend that the Commission not extend the Emergency Order relating to daily public disclosure of short positions on Form SH. We suggest alternative short position disclosure rules and short selling transaction disclosure that would significantly enhance the ability of the Commission and the public to monitor the effects of short selling. Details of our recommended disclosure requirements are provided below.

(5) We recommend that the Commission not impose a modernized version of the uptick rule or the bid test, as is currently being considered by the NYSE. Such a rule could be circumvented easily by using a dealer as an intermediary. The rule would be expensive to implement, and the implementation costs might be burdensome for smaller trading platforms trying to compete against the dominant exchanges. As such, we believe imposing such a rule would be an infeasible choice as a transition out of a short selling ban. If the Commission chooses to adopt such a rule, we recommend that it be structured so as to minimize distortions in the trading process.

The remainder of this memo is organized as follows:

I Big Picture Issues
II Alternative Exit Strategies
III Disclosure Recommendations
IV Industry Feedback on How the Emergency Orders Affect Markets
V Other Potential Effects and Loopholes
VI Comments Reported in the Media

I Big Picture Issues

Because the recent Emergency rulemaking actions were necessarily done quickly to address extraordinary market conditions, we are concerned that the process did not allow the Commission adequate time to fully consider available evidence with respect to short selling restrictions and short selling bans. This evidence does not support the assumption that banning short selling helps prevent market panics. To the contrary, there is both theoretical and empirical evidence indicating that the probability of large sudden declines in stock prices is greater when short selling is restricted than when it is permitted. In addition, the literature indicates that in general, there is a negative correlation between stock returns and short volume, indicating that short trading volume for a given stock tends to be higher on days when the stock is rising than when it is falling. This evidence suggests that, contrary to public opinion, short selling is not by any means an inherently destabilizing momentum strategy.

When short selling is restricted, and especially when it is banned, evidence indicates that the price discovery function of markets can be severely hampered, and individual stocks can become severely overvalued. When price efficiency is undermined in this way, investors will lose confidence in the price as a meaningful indicator of value, and will be more reluctant to invest.

One potential consequence of the Commission's Emergency Orders directed at short selling is that market participants may infer that the Commission believes that short sellers exacerbated the current market crisis. This in itself may have contributed to a heightened sense of fear surrounding short selling. We urge the Commission to take steps to reaffirm the Commission's longstanding view that short selling can help investors by playing a useful role in price discovery, risk management, and lowering the overall cost of trading and raising capital.

II Alternative Exit Strategies

This section discusses the likely impact of lifting the ban on stock prices since that concern is central to the discussion of possible exit strategies.

Predicting future stock prices is very complex. Many variables affect stock prices and even if we could isolate the effect of the short sale ban on stock price, it would not necessarily be a good forecast of prices after the ban was lifted since many of other variables that impact stock prices will be changing at the same time.

The academic literature suggests that prices would decline by a small amount after a ban on short sales was lifted. Even so, since every stock's facts and circumstances are substantially different, one would expect a variable impact in prices across stocks. For example, in merger arbitrage, arbitrageurs typically buy the target firm and sell short the acquiring firm. If the ban restricted this activity, then the lifting of the ban would likely result in a decline in the price of the acquirer and an increase in the price of the target. Further, because many short sale strategies are market neutral, we would not expect the same price impact across all issuers. Because of the differential impact across stocks, it is unlikely that the price impact would be large enough to result in a large systemic decline.

Also, if the fundamental problem of bad assets is solved by the passage of a government asset transfer plan, one would expect any negative price impact of the lifting of the ban to be mitigated somewhat by this effort, especially if the removal of the ban were to coincide with an announcement of a government plan. If the ban is lifted without passage of a government asset transfer plan, then the prices of financial stocks are likely to be under more downward price pressure and the probability of a systemic price decline increases slightly. However, in our assessment the probability of a systemic price decline due to the lifting of the ban is very low. The primary concern would then be that some news or market disruption would occur in tandem with the lifting of the ban and exacerbate any price impact.

While we can do little to control the flow of significant news into the market when the ban is lifted, pre-announcing when the ban will be lifted will allow the industry to better prepare for it and minimize the chance of any mechanical trading disruptions. However, pre-announcing that we are letting the ban expire may not do much to mitigate the price impact of lifting the ban on specific issuers. In other words, if prices have risen above their proper level for a certain issuer because of the short sale ban, pre-announcing is unlikely to prevent prices from adjusting to their proper level. Further, because of the mechanical effect of the ban, pre-announcing may not smooth the prices toward their true level.

A second advantage of pre-announcing is to mitigate market disruptions. If the ban is lifted in a single day, it is particularly important that the market is able to function with minimum disruption due to mechanical trading problems. Mechanical trading disruptions during a day when prices are moving rapidly can cause a loss of confidence and panics –

Deleted: 9/26/2008

there was an extreme loss of confidence in our markets after the 1987 Market Crash because many investors were unable to get trades executed on critical days. Therefore, it is important to pre-announce the lifting of the ban in order to minimize the chance of trading disruption which could exacerbate any price decline due to the lifting of the ban.

There are a number of strategies that the Commission could consider in lifting the short sale ban. Some of these strategies are not feasible as a transition rule, and OEA recommends against further considering these strategies without public comment. A comprehensive list is provided below along with the pros and cons.

A. Feasible strategies

Single-day phase-out with no transition rule
The Commission coult lift the short sale ban on all stocks as of a pre-announced date.

Pros: Simple to implement. Immediately provides relief from the disruptions caused by the ban. It is the least costly strategy for the industry.

Con: Will likely cause stocks subject to the ban to decline at least temporarily as "built up" short selling volume is absorbed by the market. May cause sudden and significant downward price pressure on stocks of systemically important financial institutions.

Limits on increases in short positions as a transition rule
To transition out of the ban, the Commission could impose a limit to increases on a participant's short position in a given stock. For example, the rule might state that no entity would be allowed to increase their short position by more than 0.0025 (one quarter of one percent) of shares outstanding per day for the first ten days after the ban is lifted. A more aggressive rule might limit new short positions to one tenth of one percent per day. The rule could include provisions for multiple accounts and a statement that lying to an executing broker is a fraud.

Pros: Easy to implement. Responsibility for compliance to the rule would be placed on brokers, so this should require no new systems programming at the exchanges. Without multiple accounts, prime brokers have the records to detect rule violations.

Cons: Multiple accounts could make this hard to enforce. We are not sure how hard the compliance for brokers will be. Aggregation units may present problems.

Gradual phase-out across stocks with no transition rule
As an alternative to a separate transition rule, the Commission could phase stocks out of the ban gradually. There are a many variations on this concept. The general concept is to phase out a given set of stocks each day, say 200 per day (5-day phase-out).

1) The Commission could phase-out the short sale ban by company name beginning with A and ending with the Z.

Deleted: 9/26/2008

2) The Commission could phase-out the short sale ban by groups of SIC codes.
3) The Commission could phase-out the short sale ban by random selection.

Pros: Mitigates the systemic effects of re-introduction of short selling. Phase-out schedule allows the Commission to stop phasing-out if problems occur. Feasible as a transition from the ban.

Cons: May cause more downward price pressure for the first stocks phased-out if short sellers are able to substitute short sales in banned stocks with short sales in the phased-out stocks. The selection of the criteria may be subject to criticism and complaints from companies who may not want to be the first stocks phased-out. It would be more costly for the industry to implement than a single day phase-out.

Implement a pre-borrow

The Commission could lift the ban for all financial stocks but have an alternative rule in place that implements pre-borrow for all financial stocks or all stocks.

Pro: May reduce fails and naked short selling significantly, but only if the T+3 order hasn't done this already.

Con: Naked short selling does not appear to have been rampant in or the cause of dramatic declines in many of the financial stocks, so a pre-borrow requirement would not address the underlying concerns. Our experience with the earlier Emergency Order indicates that a pre-borrow requirement significantly raises the cost of borrowing and impacts the entire securities lending industry. A pre-borrow requirement imposes unnecessary costs on industry participants because significantly more borrowing occurs than is actually needed to satisfy delivery obligations.

Increase margin requirements

The Commission could lift the ban for all financial stocks but ask the Fed and FINRA increase initial and maintenance margin requirements.

Pro: May reduce speculative short selling.

Con: Increasing margin requirements may result in a scramble for cash for financial entities that are currently cash-poor. Contributing to a cash crunch as this time is extremely risky. Also, increasing minimum margin might affect small investors more than hedge funds because many prime brokers set higher margins for hedge funds, it would not have a profound impact on the level of short selling.

Implement circuit breakers

1) The Commission could consider lifting the ban for all financial stocks but implement a circuit breaker that would apply to individual stocks. Circuit breakers specify that

Deleted: 9/26/2008

some rule kicks in once a threshold is reached. Circuit breakers can take many forms and be applied across individual stocks on a case-by-case basis or a group of stocks. On possibility of a circuit breaker would be that short selling would be prohibited at prices lower than 15% below the previous day's closing price. If the price falls more than 15% but subsequently rises above the 15% threshold, short selling would still be permitted at prices above the threshold.

Pro: Relatively easy to administer. Potentially limits subsequent price declines following extreme stock price declines.

Con: Does not prevent large price drops since long sellers could still drive prices downward. If it does limit a price decline, the closing prices might not reflect the true underlying value of the stock, resulting in problems for those reliant on good closing prices. Short sellers may rush in to sell if prices get close to the threshold, creating more price pressure near the price limit. There is difficulty in selecting the appropriate price limit. Trading rules would change intraday.

Short sale ability phase-in

The Commission could consider implementing a rule to initially re-introduce short sales at the close of trading (NYSE closing auction and NASDAQ closing cross) because there is a process for handling potentially large volume and large price changes at the close – as is the case for example in the annual Russell Reconstitution. That would allow two crossing sessions (close and then open) before short sales would be re-introduced into the continuous market. Also, if we needed to take small steps, we could re-introduce short selling to intraday crossing networks who are price takers with minimal disruption.

Pro: Short sellers can trade but their ability to impact price is gradually phased-in.

Con: Rules change daily. Not sure how easy this would be to implement across all markets. Some markets may opt to not allow short sales until day 3 (fluidity of order flow may mitigate this concern).

Deleted: 9/26/2008

B. Infeasible Strategies

Implement a daily limit on the volume of short selling

The Commission could lift the ban for all financial stocks but implement a daily limit on the amount of short selling that could take place in a particular stock during a day. Once that limit is reached, there could be no more short sales. The type of limit could be 50% of average daily share volume over the past month.

Pro: Limits short selling on a particular day.

Con: This is not feasible to implement as a transition rule. There is no mechanism presently in place in the financial markets to aggregate short sale volume on a real-time basis across the many markets in which a security could trade. Does not prevent large price drops since long sellers could still drive prices downward after the curb on short selling was initiated. Short sellers may rush in to sell if short sale volume approached the limit. There is difficulty in selecting the appropriate limit because share volume is very volatile. Trading rules would change intraday. Non-financial stocks may want similar treatment.

Implement a uniform bid test

The Commission could lift the ban for all financial stocks but have an alternative rule in place that implements a price test for all financial stocks. There are many forms of price tests, including the uptick rule (aka tick test) of former Rule 10a-1, the former Nasdaq Bid Test, the proposed Uniform Bid Test, and a variation on one of these three incorporating multiple ticks. We understand that a rule similar to the Uniform Bid Test is the most seriously considered at this point, so our pros and cons focus on this alternative. At the end of this section, we give pros and cons of other alternatives.

The uniform bid test would prevent a short seller from demanding liquidity by executing at the bid price. A short seller would effectively set an ask price at one penny above the bid price and wait for a buy order to arrive.

Pro: Theoretically prevents short sellers from creating rapid price drops.

Cons: This is not feasible to implement as a transition rule. When exchanges and broker-dealers reprogrammed their systems for Regulation NMS, they removed any coding that ensures compliance with the former uptick and bid test rules. Therefore, implementing this uniform bid test would require significant reprogramming that cannot be completed in a matter of weeks. System programming requirements would not be confined to exchanges, but to broker dealers, ECNs, and other trading venues.

We have no history with this type of rule, so we do not know how it actually works. Further, casual consideration leads us to a few gaming strategies that would result in the rule having no dampening effects. For example, this rule could result in an overhang problem. That is, as short sale orders queue up at the offer price waiting to get executed, two things may happen. First, long sellers may see this overhang and react to this

Deleted: 9/26/2008

information by selling. The negative price effect may be the same as if the short sellers had been allowed to execute. Second, the long sellers may use their trading advantage to manipulate prices to "bag" (trader lingo) the short sellers. In other words, long sellers drive the prices down by selling (with the short sellers following them downward at the offer price) and then buy the stock back from the short sellers at lower prices. Also, if market makers were exempt from the liquidity provider price test, they could play these games as well.

The former rules were found, through seven and a half years of careful consideration by the Commission (from the 1999 concept release to the adopted amendment in 2007), to be largely ineffective at preventing abusive short selling. This process has been held up as a model for how rulemaking at the Commission should occur. The re-implementation of a similar rule without sufficient evidence on the benefits of such a rule would likely result in a loss of credibility for the Commission.

Short sale price test phase-in

The Commission could consider implementing a variation on the uniform price test that changes each day after the ban is lifted. For example, the Commission could lift ban for all stocks but implement an alternative temporary rule in place on day one that limits short sales to be executed at prices above the NBB. On day two, allow short sellers to execute at prices at or above the NBB. On day three, allow all short sales at any price.

Pro: Short sellers can trade but their theoretical ability to impact price is gradually phased-in.

Con: This rule would have the same feasibility problems as the uniform bid test discussed above. Rules change daily. Not sure how easy this would be to implement across all markets. Some markets may opt to not allow short sales until day 3 (fluidity of order flow may mitigate this concern). Those who use short sales as hedges will incur higher costs (e.g., hedge funds pursuing convertible arbitrage strategies).

Deleted: 9/26/2008

C. Other potential circuit breakers and price tests that we do not believe the Commission to be seriously considering

Other price tests

We recommend that the Commission take the following additional discussion into consideration if these alternative price tests are considered:

1) Former Nasdaq Bid Test. A bid test in which short sales are restricted after a down-bid. During a down-bid period, short sellers would have to execute trades at prices above the prevailing national best bid (NBB) price.
2) Former 10a-1. A tick test in which short sales are restricted after a down-tick. During a down-tick period, short sellers would have to execute trades at prices above the last sale price.
3) A multiple tick variation on either of these two tests. Similar to the uniform bid test, former Nasdaq bid test, or the former 10a-1, except it requires more than one penny from the reference price.

Pro: Limits price impact of short sales over very short intervals (seconds), if at all.

Con: None of these are feasible for a transition from the short selling ban. They do not prevent large price drops since long sellers could still drive prices downward. They do not reduce the price impact of short sales over long time intervals (hours/days), and the former Nadsaq bid test provides no dampening of prices at all. If there is a panic, neither the former 10a-1 nor the Nasdaq bid test will impact prices at all. In addition, the bid and tick tests have been found, through seven years of careful consideration by the Commission, to be largely ineffective at preventing abusive short selling. The re-implementation of a bid or tick test would likely result in a loss of credibility for the Commission.

Further, any multiple tick variation on a price test has the potential to result in a de facto ban on short selling that impacts the largest and most liquid stocks the most.

Other circuit breakers

If the Commission considers a circuit breaker type rule other than the one discussed above, we have the following additional pros and cons. Such alternative circuit breakers include:

1) Individual stock short sale price test circuit breaker – implement a short sale price test for the rest of the day for an individual stock if the price of a given stock drops by more than 15% from the previous day's closing price.
2) Short sale price test circuit breaker with a market wide or sector limit – implement a short sale price test for the rest of the day for all financial stocks if the price of the NYSE Financial Index drops by more than 15% from the previous day's closing price.

Deleted: 9/26/2008

3) Short sale ban circuit breaker with a market wide or sector limit – ban short selling for the rest of the day for all financial stocks if the price of the NYSE Financial Index drops by more than 15% from the previous day's closing price.

Pro: Theoretically limits subsequent price impact following extreme stock price declines.

Con: Any implementation of a price test would make the rule infeasible as a transition rule. Short sellers may rush in to sell if prices get close to a price limit creating more price pressure near the price limit. Does not prevent large price drops since long sellers could still drive prices downward. Trading rules would change intraday.

SEC_OEA_FCIC_001166

III Disclosure Alternatives

We recommend that the Commission consider a set of enhanced disclosure requirements. The goal of these disclosure requirements would not be to curtail or discourage short selling, but to enable the Commission and market participants to have better and more timely information about how short sellers may be affecting markets. Also, the proposed disclosures would give the Commission additional tools to be able to react quickly in the event of another market crisis or an episode of possible market manipulation. We emphasize that these recommendations are preliminary, and should be vetted with the public and with the various affected market participants.

A. Add a short sale indicator to the trade print

Currently, market participants are required to report all their equity trades publicly within 90 seconds of when they execute. These trade reports are disseminated in real time to all market participants. The trade report identifies the time, size, price, and venue where the trade was reported but without any information that would identify the counterparties to the trade. The current trade report does not contain any information that indicates whether the selling side of the transaction was a short seller. The Commission could consider requiring that an indicator be added to the trade report for short sales. We believe that such a policy would have some implications for how short and long sellers implement their trading strategies, and might result in an increase in execution costs for short sellers. Overall, however, we think such a rule would dramatically increase the level of transparency for short selling in the aggregate, while causing only minor disruptions for individual market participants.

This rule would be quite costly to implement and would require a fair amount of time. As an intermediary step, the SROs could be required to make the short selling flags available on a delayed basis through a web download. This is the exact data that the SROs were required to make publicly available during the Regulation SHO pilot period beginning in 2005. When the pilot period ended, the Commission no longer required them to make it publicly available, but the Commission staff asked the SROs to maintain the capability to generate the data internally and to make it available to Commission staff on request. Consequently, this intermediate step would be very quick and relatively low cost to implement.

B. Updated and More Timely Dissemination of Short Interest Data

Short Interest data is currently collected by the primary listing exchange from their members two times a month, and is publicly released with a significant delay (up to 12 days). During the current crisis, OEA found that the frequency was so course and the lag so great that it was not possible to provide meaningful data to the Commission on short interest trends during the crisis. The Commission might consider increasing the frequency of short interest reporting to daily, and reducing or eliminating the reporting lag.

Deleted: 9/26/2008

C. Detailed Short Interest Report

Our understanding is that as part of compiling the bi-monthly short interest summary, the exchanges create a short interest report that breaks down the short interest by clearing member. We understand that this report can be made available to the SEC by request. We recommend that the Commission require the SROs to provide these reports to the Commission automatically.

D. Delayed Disclosure of Large Positions through 13f and/or 13h

The Commission could consider requiring delayed disclosure of short positions on a quarterly basis, in a manner analogous to current 13f disclosure of long positions. The current emergency order, which makes daily positions publicly available at a two week lag, is untenable for private asset managers, as revealing the proprietary nature of their positions compromises their business model. Despite a few bad apples, private asset managers as a group perform a very critical role in helping to uncover new information and incorporating into prices, and thus making market more efficient. Instead of high frequency public disclosure, the Commission could require that market participants with large short positions report them to the Commission through the authority granted in Section 13h.

E. Frequent Non-Public Reporting of Short Positions

Although daily or weekly public disclosure of short positions can compromise the business model of private asset managers, daily or weekly disclosure to the Commission would enhance the Commission's ability to monitor the short selling activities of market participants. This proposal would be costly, and would likely be passionately opposed by a significant portion of the hedge fund industry.

Deleted: 9/26/2008

IV Industry Feedback on How the Emergency Orders Have Affected Markets

This section summarizes what we have learned from conversations with industry professionals and from media reports summarizing statements of industry professional as to the impact of the Emergency Orders. Staff of the Division of Investment Management contributed to this section.

- Several ETFs have temporarily halted creation of new shares. The managers were worried about their ability to obtain swap agreements and other instruments that provide them short exposure. The swap agreements had become too expensive or were unobtainable. Firms issuing such swaps typically hedge their exposure by going short. The result of the ETF action is that ETFs may trade at a premium when they aren't creating new shares since there are no new shares to meet demand. On 9/18/08 the ETF UltraShort Financials ProShares traded at a hefty premium to the value of its underlying holdings. (Wall Street Journal, 9/24/08)

- Brokerage firms are limiting their customers' activity because investors who pursue certain strategies in options can inadvertently take short positions in a company's stock. The brokerages have taken aim at their customers' ability to exercise puts, largely because it could allow those customers to sell stock they don't own. Some firms are preventing their customers from exercising their puts early if, by doing so, they become short a company's stock. Other firms have told investors that their put contracts can only be automatically exercised at expiration. (Wall Street Journal, 9/23/08)

- Options spreads have increased. For options on liquid banned stocks, spreads have more than doubled. For options on less liquid banned stocks, spreads have almost tripled. For options on stocks not on the banned list, spreads are up more than 50% in more liquid options, and have doubled in less liquid options. (Data provided by Citadel through Jennifer Han, Legal Counsel, Managed Funds Association, e-mail 9/25/08) Preliminary OEA analysis is consistent with Citadel's analysis.

- Option depth has declined significantly for options written on stocks subject to the ban. (reported in phone call with ISE staff Tom Ascher, Gary Katz, and Boris Ilyevsky.

- On Tuesday, there were 13.7 million options contracts that traded hands, representing a 30% drop from the September daily average and a 54% drop from the high reached Sept. 18, according to the Options Clearing Corp. Trading volumes have fallen because market makers feel uncertain about their ability to hedge positions they take in options. (WSJ, 9/24/08) Preliminary OEA analysis confirms that option volume has declined but the current volume levels are similar to the levels at the end of August and beginning of September. This volume

Deleted: 9/26/2008

decline occurs at a time volatility has increased. In a normal market we would expect option volume to increase with volatility.

- The suspension of lending programs would require the lender to return the cash collateral to the borrower, which would require the lender to redeem the reinvested cash collateral from its reinvestment vehicles (registered and unregistered money market funds). This could be problematic if the reinvestment fund is experiencing liquidity issues. We know that reinvestment vehicles are often managed like, and invest in the same kinds of instruments as, money market funds. We know that some reinvestment funds have experienced liquidity problems, and have restricted redemptions by lending funds. We do not know the extent of this. We also have been told that some cash reinvestment fund managers are entering into support agreements and taking other measures to try to maintain the pricing and redeemability of the securities of these reinvestment funds. Gene Gohlke in OCIE has told us that withdrawals of cash collateral from cash collateral reinvestment funds by securities lenders may have been a contributing factor in the liquidation of the Institutional Putman Prime Money Market Fund and the illiquidity of the Reserve Fund. (Reported by Division of Investment Management)

- Wall Street banks are making it harder for merger arbitrage funds to borrow money to invest in mergers and acquisitions. Losses in debt and other investments have forced some "multistrategy" hedge funds to dump shares of companies being acquired, among their most liquid positions. That selling has lead to a widening spread between the share prices of certain companies and what they are slated to be bought for. (WSJ, 9/24/08)

- Certain mutual fund complexes, including Vanguard and Columbia Funds, have suspended their securities lending programs. We understand that at least two other smaller fund complexes have also terminated their programs.[1] We did not talk with these funds and do not know the reason these funds suspended lending. We would speculate that any or all of the following reasons are possible: (i) concern that the borrowers would not return (or timely return) the lent securities;[2] (ii) concern that the cash collateral reinvestment pools (typically unregistered and registered 2a-7 funds) would become illiquid and restrict redeemability, and/or would decline in value causing a loss to the lending fund;[3] (iii) difficulty

[1] We were not told their names.
[2] There is greater concern today than in the past perhaps because some borrowers may be in more precarious financial situation today than in the past, and the creditworthiness of borrowers has appeared to change rapidly in recent times. Lehman, for example, was a securities borrower. The lending fund and its lending agent are supposed to monitor the creditworthiness of borrowers.
[3] Lending funds reinvest the cash collateral in registered and unregistered 2a-7 funds ("reinvestment funds"). Some of these reinvestment funds have experienced the same problems that retail and institutional money market funds have been experiencing. Some reinvestment pools have limited redemptions, permitted only redemptions in-kind, or permitted scheduled redemptions.

Deleted: 9/26/2008

managing the differential between the rebate rate and the cash reinvestment rate;[4] (iv) a determination that the monetary benefits derived from securities lending do not outweigh the risks in the current climate (which include those enumerated above, among others); and/or (v) to some extent "wanting to support" the SEC's ban on short selling.[5] (Reported by Division of Investment Management)

- "List risk" is developing. Since the list of banned stocks has changed frequently and may change again, trading can dry up in stocks that are not even on the list. Investors are avoiding trading in some stocks they fear have a possibility of being added to the list. (Interview with industry participant)

- There is confusion in the lending market with respect to interpretation and application of the new T+3/T+6 delivery requirements, and, as a result, funds that lend are rethinking their lending programs. (Reported by Division of Investment Management)

- Some industry participants have told us that the short selling ban itself has not negatively affected securities lending. Rather, the concerns and negative impact are due to other factors, especially the uncertainty with respect to the new T+3/T+6 delivery requirements. We also are hearing from members with lending programs that there are an increasing number of fails solely because custodians are not getting the lent securities back in a timely manner. These fails, combined with the aggressive buy-ins by brokers (which is expected to be extremely high when the long sale requirement kicks in), is leading more and more members to err on the side of caution and cease all lending activity. Members are also asking for clarity regarding how a broker-dealer can demonstrate that it has "a net long position or net flat position on its books." (Reported by Division of Investment Management)

V Other Potential Effects and Loopholes

This section summarizes other possible effects of the Emergency Order that have not been documented as realized, but have been raised as possibilities by the media, industry professionals, and SEC staff.

- An investor purchasing a large number of shares of a financial company might want to hedge his position by shorting a company in the same industry. As such, he may be less inclined to do any buying. The ban might restrict trading in

[4] Lending funds that receive cash collateral make their money by reinvesting the cash collateral and earning interest off the reinvestment. When some securities are lent, the borrower is paid a rebate. This rebate is often based on the Fed Funds Open or Fed Funds Target rate. When a rebate is paid, the reinvestment interest rate must exceed the rebate rate or the lending fund will lose money.

[5] We have been told that some pension funds, like CalPERS and CalSTRS, have suspended lending certain stocks for this reason.

Deleted: 9/26/2008

certain smaller financial shares, compounding the illiquidity they have experienced lately. (WSJ, 9/20/08)

- Quantitative hedge funds contribute greatly to daily trading. They often buy large amounts of stocks while at the same time selling another large group of stocks. This process helps keep the market liquid. Such trading could be impeded if they can't short certain stocks, adding to the market's volatility. (WSJ, 9/20/08)

- There may be an impact on the convertible bond and merger arbitrage market. Traders there regularly take short positions as a market neutral strategy, rather than to express a negative view. The ban could make it harder for financial companies to issue convertible bonds, sell rights offerings or engage in merger deals. (WSJ, 9/20/08)

- It may be technically impossible for the equity-index-futures market to function properly. Arbitrageurs in this market generally short stocks. (WSJ, 9/20/08)

- Some short selling funds may be pushed out of business which would hurt the pension funds and others invested in these funds to protect their downside. (WSJ, 9/20/08)

- There could be a large potential impact on the equity lending market. A very rough calculation can be made from numbers via Vodia Group and Astec research reports. The reports estimate about $717 billion in U.S. equity lending per year with an average lending fee of about 0.37%. With the short sales ban, that leads to $2.65 billion per year that investors are losing. If you add the fees generated by prime brokers (three times the amount) and custodians (two times the amount), you get about $16 billion in total fees generated by U.S. equity lending. Securities lending generates significant revenue for both Wall Street firms and mutual/pension funds.

- Trading in the banned names may move overseas to alternative venues where short selling is not banned. The SEC will lose jurisdiction over the trading in U.S. securities.

- It has been suggested that insiders of firms on the banned list should not be allowed to sell. One idea buzzing around Wall Street after the ban on shorting bank stocks: How about a temporary ban on insider sales by executives at banks with access to the Treasury's bad-loan bailout plan? Or those running firms on the no-short-selling list? (WSJ, 9/22/08)

- It is our understanding that there may be adverse tax consequences for lending funds if the borrowers are not able to return the loaned securities, and pay the lender cash instead. We are told that if the borrowed securities are returned, the transaction may be a tax-free event. But if the borrower returns cash instead of the securities (because the borrower is unable to locate the securities) that may

Deleted: 9/26/2008

require the lender to recognize a capital gain or loss. There is particular concern with respect to funds that have October 31 fiscal year ends. Those funds might need to sell portfolio securities, at perhaps an inopportune time, to pay out the capital gains. (Reported by Division of Investment Management)

Loopholes

- Trading by sophisticated traders is likely to migrate to the equity swap market and other derivatives. Credit-default swaps allow investors to wager on falling prices. These swaps are not traded on public markets and have raised alarms for their recent growth and lack of transparency.

- Investors may use ETFs to bet against a particular sector. These ETFs are popular among professionals as well as individual investors.

VI Comments on the Emergency Orders

Comments by Principals

- Harvey Pitt, Former SEC Chairman: Pitt characterizes the ban as "an excessive and potentially dangerous solution to a far more complicated problem." He adds, "If you ban all short-selling, what you're really doing is depriving the market of liquidity. You're not helping the market." (Business Week, 9/19/08)

- Larry Harris, Former SEC Chief Economist: "Proposals to ban short-selling are a highly politically motivated attempt to stop reality. To ban short selling is to in effect say that the government is going to try to determine what stock prices should be." (LA Times, 9/19/08)

- Jonathan Macey, Yale Securities Law Professor: Banning short sales is "an abomination. Short selling is a legitimate, critical market strategy that has incredibly important functions, including ferreting out information that could not be ferreted out any other way." (LA Times, 9/19/08)

- Edward J. Kane, Kenneth E. Scott, Chester Spatt (Former SEC Chief Economist), Shadow Financial Regulatory Committee: "The Committee sees no good reason for intensifying the regulation of short selling. In line with the SEC's investor protection mission, short selling informs and protects investors against artificially inflated stock prices. The propagation of malicious and fraudulent rumors is already punishable under the securities laws. Where policymakers could improve the handling of short sales is to focus on increasing the transparency of securities lending. One of the worst things that authorities might do would be to reintroduce some version of the tick rule. Imposing a new x-cent tick test (requiring an up-tick of at least x cents in the stock price) would be tantamount to an outright ban on short sales for securities trading with spreads less than x." (Statement of the Shadow Financial Regulatory Committee on Regulation of Short Selling, 9/15/08)

Deleted: 9/26/2008

Comments by Industry Participants

- Ric Dillon, Chief Executive and Chief Investment Officer, Diamond Hill Investment Group: He calls the SEC's action "misguided" and says his own publicly traded company asked to be removed from the no-short-sale list. "What you've done by eliminating the short sellers is eliminated information content. That's bad for markets." (WSJ, 9/24/08)

- John Boich, Portfolio Manager, Security Global Investors: "Hopefully it's not the beginning of something larger. If it is, then you're talking about a wholesale change in how alternative strategies are managed." (WSJ, 9/24/08)

- If a list of banned stocks had been created in 2001, Enron's name would likely have been included. Short sellers played a vital role in pricing efficiency for Enron's stock (and Tyco, Fannie Mae and Freddie Mac) during its downfall. (interview with industry participant)

- Kevin Lynch, Managing Director for consulting firm, RogersCasey: A renewal of this ban could rattle investors who see these actions becoming so commonplace as to curb the hedge-fund industry. "That could accelerate hedge-fund redemptions." (WSJ, 9/20/08)

- "Some of my clients are literally closing their books and going on their vacation for two weeks — they can't operate in this environment," said Meredith A. Whitney, a financial services analyst. "You pack up and come back and play the game when you know what the rules are." (New York Times, 9/18/08)

- William J. Brodsky, the chief executive of the nation's largest options exchange, Chicago Board Options Exchange, lashed out at the S.E.C. "The need for the policy intervention notwithstanding, it is difficult to comprehend the merits of a draconian measure that will result in the sudden and severe removal of liquidity from the marketplace at the same time that the government is taking unprecedented steps to preserve it," he said in a statement. (NYT, 9/18/08)

- In Europe, leaders in hedge-fund industry cited numbers showing low levels of stock short selling in the UK financial companies as vindication, confirming their industry wasn't behind the collapse in banking shares. (WSJ, 9/22/08)

Deleted: 9/26/2008

- "Unfortunately, the recent spate of hurried actions may worsen the quality of our capital markets at a time when we need to attract investors – both pessimists and optimists – by promoting deep liquidity, vigorous price discovery and open competition. These are the key factors in determining the value of securities." (WSJ, James Chanos editorial, 9/22/08)

- "The vast majority of equity short sales are market neutral." (WSJ, James Chanos editorial, 9/22/08)

- "Short selling comprises roughly 4% of total shares outstanding on the NYSE. Short biased funds make up a small fraction of the $2 trillion managed by private investment companies." (WSJ, James Chanos editorial, 9/22/08)

Comments on Short Sales Disclosure Rule

- The short positions will be disclosed to the public without any context or explanation. Readers of the disclosures will not know whether the position represents a fundamental bet on a company's future or merely a piece of a hedging strategy. The SEC requires long positions to be reported only four times a year, with a 45-day lag. In addition, the SEC allows portfolio managers to request to keep certain long positions confidential if they believe disclosure will compromise their trading strategy. The SEC has offered no explanation for why the reporting of short sales should be so much stricter than that for long positions. It's not clear what good purpose is served by publishing these short positions rather than privately monitoring by the SEC to check for evidence of manipulation. (WSJ, 9/25/08)

- James Chanos, Founder and President of Kynikos Associates, LP and Chairman of the Coalition of Private Investment Companies: "I believe the SEC has every right to obtain and review information about short positions for market surveillance purposes, but forcing public disclosure will have serious consequences for the market."
    - "Companies may retaliate against short sellers."
    - "Fund managers will lose their ability to manage assets without revealing their strategy."
    - "Other traders will 'pile on,' and may trigger panicky selling if an investor sees that noted short sellers have shorted the stock."
- Byron Wien, chief investment strategist at Pequot Capital Management, the big hedge fund, said that forcing big investors to disclose short positions could create a run on stocks. It might not be immediately apparent whether investors with short positions were using it to hedge another position or bet against stocks. (NYT 9/18/08)

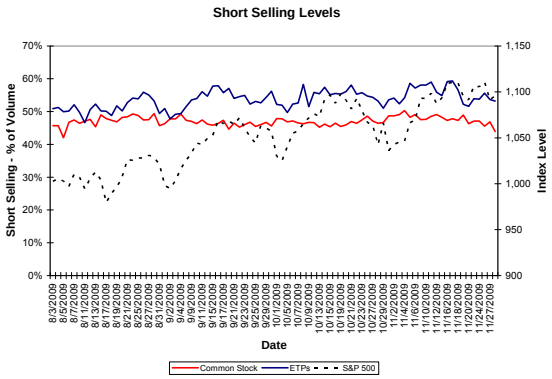
DRAFT for Comments

Monthly Short Selling Report

Total Short Selling

In November 2009, short selling accounted for **48%** of reported volume in common stocks according to the daily short selling volume data.[1] This is similar to the October 2009 figure. This level was fairly constant throughout the month and fluctuated slightly with the market, as reflected in the S&P 500 index levels (-7% correlation coefficient). While this correlation is negative (indicating that short selling rose when returns were lower, this correlation is much lower than the October figure.



Short selling of exchange traded products (ETPs) in November was slightly higher than common stock at 55%, similar to the October 2009 figure. ETP short sales dropped noticeably around the third week of the month and remained at this lower level. They showed a strong tendency to move with the level of the S&P 500 (47% correlation coefficient).

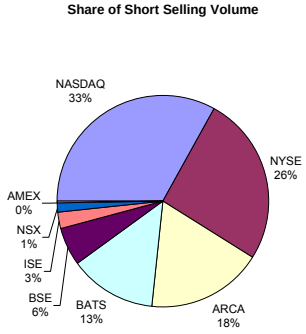
Most-Shorted Securities

The daily data is also useful for identifying the most shorted securities. Please contact OEA if you would like more information on the most-shorted stocks. In November, the stock most shorted was Kilroy Realty Corp. a REIT listed on the NYSE. Short sales made up 68.3% of the share volume. The shorting in this stock seemed higher when prices were declining as the level of short selling has a negative 12% correlation with the stock returns. In addition, the price of Kilroy Realty rose 9.1% in the month of November.

Most of the securities that were shorted the most in November had prices that went up and half had short selling that was positively correlated with returns. Securities with positive correlations are unlikely candidates for manipulation because short selling is higher when prices are rising.

Ticker	Name	Short Level	Correl	Return
	Common Stock			
KRC	Kilroy Realty	68.3%	-12.1%	9.1%
BJRI	BJ's Rest., Inc.	67.8%	29.6%	7.0%
WIT	Wipro Ltd.	67.7%	40.1%	16.6%
PRSP	Prosperity Bancshrs.	67.6%	26.5%	11.3%
WGO	Winnebago Ind.	67.0%	-36.5%	-5.7%
	ETPs			
VIG	Vanguard Dvd	72.3%	-5.9%	5.8%
SPY	S&P Dep Receipts	69.5%	47.8%	6.2%
OEF	iShares S&P 100	68.3%	-21.8%	6.5%
VTV	Vanguard Value	67.3%	-5.1%	6.1%
QQQQ	Powershares QQQ	67.6%	19.9%	6.3%

For half the securities the correlation between the short selling level and the security return is negative. This means that short selling is higher when prices are going down. Nevertheless, four of the five securities with negative correlations show positive returns for the month. The short selling in these securities is not necessarily abusive and much more analysis would be necessary to determine manipulative intent. A negative correlation could indicate that short sellers applied price pressure without any manipulative intent or that they were merely passive momentum traders.



Market Share

We also examined which markets tend to account for more short selling.[2] Some strategies involve shorting only on certain exchanges. We found that the markets' share of short selling coincided closely with their share of volume, although Nasdaq's share of short selling volume was 1.6% higher than it's share of all volume and NYSE's share of short selling was 1.9% lower than it's share of all volume.

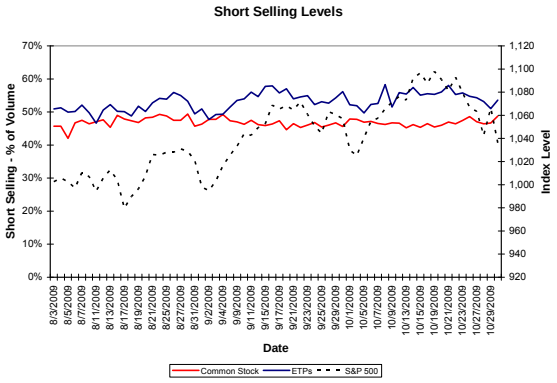
[1] This might be an overestimate because stocks that have no short selling may not show up in the data. In addition, our classification into common stock is imperfect and based on characteristics of the ticker and absence from a list of ETPs.

[2] This report does not include FINRA data, but we hope to include it in the near future.

Monthly Short Selling Report

Total Short Selling

In October 2009, short selling accounted for **47%** of reported volume in common stocks according to the daily short selling volume data.[1] This is similar to the September 2009 figure. This level was fairly constant throughout the month and increased when the market declined, as reflected in the S&P 500 index levels (-51% correlation coefficient). While this correlation is a striking departure from the previous two months, the variation in short selling is pretty small.



Short selling of exchange traded products (ETPs) in October was slightly higher than that of common stock at 54%, this is very similar the September 2009 figure. This level did not vary much throughout the month, and it varies somewhat with the level of the S&P 500 (-7% correlation coefficient).

Most-Shorted Securities

The daily data is also useful for identifying the most shorted securities. Please contact OEA if you would like more information on the most-shorted stocks. In October, the stock most shorted was Philippine Long Distance Telephone Co., an ADR listed on the NYSE. Short sales made up 70.4% of the share volume. The shorting in this stock seemed higher when prices were rising as the level of short selling has a positive 24% correlation with the stock returns. In addition, the price of Philippine Long Distance Telephone Co. rose 3.7% in the month of September.

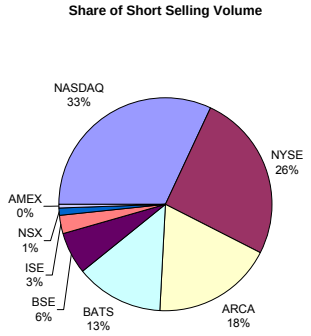
Most of the securities that were shorted the most in October had prices that went up but half had short selling that was positively correlated with returns. Securities with positive correlations are unlikely candidates for manipulation because short selling is higher when prices are rising.

Ticker	Name	Short Level	Correl	Return
	Common Stock			
PHI	Philip. Lg Ds ADR	70.4%	23.6%	3.7%
BJRI	BJ's Rest., Inc.	69.3%	-24.3%	6.5%
GAP	Great Atlantic Pac	67.3%	-34.4%	11.2%
FWRD	Forward Air Corp.	66.5%	-27.3%	-7.8%
WTFC	Wintrust Fin. Corp.	65.9%	7.1%	0.9%
	ETPs			
VIG	Vanguard Dvd	73.2%	-41.8%	1.8%
AGG	iShares Barc A. Bd	71.2%	3.1%	0.2%
PGX	PwrShares Pfd	68.9%	19.8%	-2.8%
SPY	S&P Dep Receipts	68.7%	-35.7%	-1.9%
XRT	SPDR S&P Retail	67.9%	46.2%	-1.1%

For half the securities the correlation between the short selling level and the security return is negative. This means that short selling is higher when prices are going down. Nevertheless, three of the five securities with negative correlations show positive cumulative returns for the month. The short selling in these securities is not necessarily abusive and much more analysis would be necessary to determine manipulative intent. A negative correlation could indicate that short sellers applied price pressure without any manipulative intent or that they were merely passive momentum traders.

Market Share

We also examined which markets tend to account for more short selling.[2] Some strategies may involve shorting only on certain exchanges. We found that the markets' share of short selling coincided closely with the markets' share of volume, with no market deviating by more than 1%.



[1] This might be an overestimate because stocks that have no short selling may not show up in the data. In addition, our classification into common stock is imperfect and based on characteristics of the ticker and absence from a list of ETPs.

[2] FINRA has not yet started to disseminate the volume data, so this analysis does not reflect TRF activity.

Economic Analysis of the Short Sale Price Restrictions Under the Regulation SHO Pilot

Office of Economic Analysis
U.S. Securities and Exchange Commission

This Draft: September 14, 2006

Economic Analysis of the Short Sale Price Restrictions under the Regulation SHO Pilot

A Study by the Staff of the Office of Economic Analysis[1]

I Introduction

A. Background

Short selling in exchange-listed stocks ("Listed Stocks") in the U.S. has been subject to a "tick test" since 1938. Rule 10a-1 under the Securities Exchange Act of 1934 allows short sales to occur only at an uptick or a zero uptick (also known as a "zero-plus tick") for Listed Stocks. That is, short sales in Listed Stocks may be effected above the last trade price or at the last trade price if the last trade price is higher than the most recent trade at a different price.[2] Prior to August 1, 2006, Nasdaq was not operating as an exchange and, therefore, its stocks were not Listed for the purposes of Rule 10a-1. However, in 1994, the National Association of Securities Dealers ("NASD") introduced a "bid test" for Nasdaq National Market Stocks ("Nasdaq NM Stocks"), which applies to trading on Nasdaq and trading reported to the NASD. This rule, the former NASD Rule 3350, specifies that whenever the bid is a downtick from the previous bid, traders other than market makers may sell short only at prices one penny above the bid.[3] Within this report, the tick test and bid test will be described more generally as "price restrictions."

---

[1] For further information, questions, or comments, please contact Amy Edwards (edwardsa@sec.gov), Stewart Mayhew (mayhews@sec.gov), Tim McCormick (mccormickt@sec.gov), or Allan Zebedee.

[2] Paragraph (a) of Rule 10a-1 governs short sales of any security registered on, or admitted to unlisted trading privileges on, a national securities exchange if such transactions are made pursuant to an effective transaction reporting plan as defined in Rule 600 of Regulation NMS. Unless a specific exemption applies, short sales are prohibited at a price that is either (1) below the last reported price of a transaction reported pursuant to an effective transaction reporting plan (known as a "minus tick"); or (2) at the last reported price if that price is lower than the last reported different price (known as a "zero-minus tick").

[3] When Nasdaq began operating as a national securities exchange, NASD Rule 3350 was replaced by Nasdaq Rule 3350 for Nasdaq NM stocks traded on Nasdaq, and NASD Rule 5100 for Nasdaq NM stocks traded over-the-counter and reported to a NASD facility. In connection with Nasdaq commencing operations as a national securities exchange the Nasdaq National Market was renamed to the Nasdaq Global Market and Nasdaq NM stocks were renamed Nasdaq Global Market stocks. See NASD Rule 4200(a)(6) (providing that the Nasdaq Global Market is the successor to the Nasdaq National Market); see also Securities Exchange Act Release No. 54071 (June 29, 2006),

In July 2004, the Securities and Exchange Commission (the "Commission" or the "SEC"), adopted Regulation SHO, which contains Rule 202T, allowing the Commission to establish, by separate order, a pilot program to examine the efficacy of price restrictions.[4] At the same time, the Commission issued an order ("Pilot Order") establishing a pilot program ("Pilot") exempting a third of the stocks in the Russell 3000 Index ("Russell 3000") from all price restrictions.[5] The pilot stocks constitute a sample of Russell 3000 stocks that is stratified across average daily trading volume levels within each of three groups, corresponding to New York Stock Exchange ("NYSE,") Nasdaq, and American Stock Exchange ("AMEX") issues.[6] The Pilot went into effect on May 2, 2005, and was scheduled to end on April 28, 2006,[7] but has been extended to August 6, 2007 to allow the Commission to consider potential rulemaking after evaluating the results of the Pilot.[8]

The Pilot was designed to enable the Commission and the broader community to evaluate whether the price restrictions have a substantive impact on market quality, and more generally to achieve a deeper understanding of how price restrictions affect the trading process. In its Pilot Order, the Commission provided further explanation for the Pilot:[9]

> The Pilot will enable us to obtain empirical data to help assess whether short sale regulation should be removed, in part or in whole, for actively-traded securities, or if retained, should be applied to additional securities. The Pilot will allow us to study trading behavior in the absence of a short sale price test on the stocks selected by comparing the trading behavior of the control group stocks to that of

---

71 FR 38922 (July 10, 2006) (File No. SR-NASD-2006-068). For purposes of this study, we refer to Nasdaq NM stocks as Nasdaq NM or Nasdaq Stocks and not Nasdaq Global Market stocks. Prior to Nasdaq commencing operations as an exchange, Nasdaq securities traded on exchanges on an unlisted trading privileges basis were not subject to any price restriction.

[4] See the adopting release, SEC Release No. 34-50103, July 28, 2004.

[5] See the first Pilot Order, SEC Release No. 34-50104, July 28, 2004.

[6] Stocks were selected for this sample by sorting the 2004 Russell 3000 first by listing market and then by average daily dollar volume from June 2003 through May 2004, and then within each listing market, selecting every third company starting with the second.

[7] SEC Release No. 34-50747, November 29, 2004.

[9] SEC Release No. 34-50104, July 28, 2004.

> the Pilot stocks through empirical analysis. We will examine, among other things, the impact of price tests on market quality (including volatility and liquidity), whether any price changes are caused by short selling, costs imposed by a price test, and the use of alternative means to establish short positions.

To the extent that price restrictions have discernable effects, these should appear as differences between the pilot stocks, which the Commission selected to be a representative subsample of the Russell 3000 index, and the rest of the Russell 3000, which serve as control stocks. The results observed from the Pilot will help inform any subsequent rulemaking that the Commission may consider at the conclusion of the Pilot.

B. Overview

The goal of this study is to examine whether eliminating price restrictions has had any impact on market quality, broadly defined. We compute and compare various market statistics for pilot and control stocks both before and during the Pilot. The pilot stocks and control stocks are statistically similar prior to the Pilot. The analysis is conducted separately for both Listed Stocks and for Nasdaq NM Stocks to help distinguish the tick test from the bid test.

We designed this study to evaluate the various policy alternatives outlined in the first Pilot Order.[10] For example, the results of the Pilot might suggest eliminating all price restrictions, extending a uniform test to all securities, or removing price restrictions for a subset of stocks. Any of these alternatives would potentially affect not only the stocks in the Russell 3000, but others that have a lower market capitalization and perhaps are less actively traded than those in the pilot study. Price restrictions may have different effects for larger and smaller market capitalization stocks, or for more actively traded and less actively traded stocks. Accordingly, as part of our comparison of pilot and control stocks, we partition the sample into

[10] See SEC Release No. 34-50104, July 28, 2004.

groups based on market capitalization and turnover (trading volume divided by shares outstanding). The results for the smallest and least actively traded stocks within the Russell 3000 would be the most informative about the likely impact of price restrictions for those stocks that are not in the Russell 3000. Moreover, comparing large and small stocks (or high and low volume stocks) within the Russell 3000 should reveal whether any effects of the price restrictions are related to size or volume.

This study investigates various hypotheses relating to the potential effects of price restrictions. First, if price restrictions represent an economically meaningful constraint on short selling, they may induce some traders to avoid short selling or to reduce the size of their short positions. Thus, we test whether the level of short trading volume and short interest are significantly different for pilot and control stocks.[11] Both for Listed Stocks and Nasdaq NM Stocks, we find that price restrictions reduce the volume of executed short sales relative to total volume, indicating that price restrictions indeed act as a constraint to short selling. However, in neither market do we find significant differences in short interest across pilot and control stocks.

To the extent that price restrictions are applied in some markets and not in others trading the same stocks, traders who find the restrictions binding might avoid the constraint by choosing a venue where the constraint is not applied. Specifically, because not all markets that trade Nasdaq NM Stocks apply the Nasdaq Bid Test, short sellers can route their orders to avoid the rule., Removing the rule eliminates the need to avoid it and therefore might affect where short sales in Nasdaq NM Stocks are executed. Our results indicate that Nasdaq's share of short selling volume is negatively impacted by price restrictions, suggesting that some short sellers are routing orders to avoid price restrictions.

[11] Short interest is the total number of shares of a security that have been sold short and have not yet been repurchased.

Additionally, traders can avoid price restrictions by synthetically shorting in the option market rather than shorting the stock.[12] To measure the extent to which price restrictions drive short sellers to the option market, we compare option market trading activity for pilot and control stocks. We find no evidence that short sale price restrictions in equities have an impact on option trading or open interest.[13]

Regardless of whether price restrictions have any substantive impact on overall market liquidity or inhibit manipulation, they affect the ability of short sellers to demand liquidity by getting prompt execution of market orders. For purely mechanical reasons, we would expect price restrictions to affect the number of trades occurring on downticks vs upticks, and the percentage of time the market is in an upbid or downbid state. For Listed Stocks, we find that the application of the tick test results in significantly fewer than 50% of transactions occurring on downticks or zero downticks, while trading is more balanced when the tick test does not apply. For Nasdaq NM Stocks, we find that the percentage of time the market is in a downbid state declines when the bid test is removed, suggesting that downbids occur more regularly when the bid test applies.

To the extent that price restrictions inhibit the free movement of stock prices, they might make markets less liquid. On the other hand, because short sellers can rarely execute against a bid quotation, price restrictions force short sellers to act more like liquidity suppliers than liquidity demanders. Therefore, removing them might decrease the perceived supply of liquidity. To test whether price restrictions have a more general impact on liquidity or volatility, we compare quoted and effective spreads, intraday volatility, and the daily price range across

[12] A synthetic short position can be achieved by buying a put option and writing a corresponding call option in the same security. The term synthetic refers the fact that you can replicate the payoffs of an equity short sale without actually short selling the equity itself.
[13] Open interest is the total number of options contracts that have not yet been closed or fulfilled by delivery.

SEC_OEA_FCIC_001184

pilot and control stocks. We find that quoted depths are augmented by price restrictions but realized liquidity is unaffected. Further, we find some evidence that price restrictions dampen short term within-day return volatility, but when measured on average, they seem to have no effect on daily return volatility.

Finance theory predicts that under certain conditions, constraints on short selling may cause securities to be misvalued by the market, particularly when investors have highly divergent opinions about the stock.[14] A simple argument is that short sale constraints make it more costly for those investors who have a negative opinion of a stock to trade on their beliefs, and thus, their views may be reflected less in the stock price than those who have a positive view. Under more general assumptions, theoretic models predict that short sale constraints can cause stocks to be either overvalued or undervalued.[15] To test whether price restrictions constitute an economically consequential short sale constraint that influences equilibrium stock prices, we investigate whether the prices of pilot stocks react in response to the removal of the rule. We find that for Listed Stocks, control stocks outperform pilot stocks on average by about 24 basis points on the first day of the Pilot, suggesting that the tick test may cause stocks to be slightly overvalued. For Nasdaq NM Stocks, no significant return differential was observed surrounding the initiation of the pilot. We also examine stock returns for a six-month period following the initiation of the pilot program, to ascertain whether the elimination of price restrictions has had any discernible effect on stock prices over a longer horizon. We find that pilot stocks and control stocks have similar returns over this horizon, but some tests show weak evidence consistent with the hypothesis that price restrictions facilitate over-pricing. In the absence of price restrictions, prices do not rise as much as with price restrictions, leading to a lower equilibrium price.

[14] See, for example, Lintner (1969), Miller (1977), and Scheinkman and Xiong (2003).
[15] See Gallmeyer and Hollifield (2006).

One view of price restrictions is that they help prevent "bear raids," or that they make it more difficult for would-be manipulators to drive prices down below their true values. On the other hand, price restrictions might also make it more difficult for short sellers to move prices back toward their true value in response to upward manipulations. Because price restrictions are inherently short-term constraints, any substantive impact on the susceptibility of securities to manipulation is most likely to be manifest at short horizons. For this reason, we focus our investigation on price patterns that might indicate manipulative behavior at a daily or intraday frequency. To explore these issues, we proceed along three avenues of investigation.

First, to the extent that price restrictions create an environment less conducive to price patterns that might indicate downward manipulation and more conducive to price patterns that might indicate upward manipulations, we might expect to observe more extreme negative returns, and fewer extreme positive returns, for pilot stocks than for control stocks. To investigate this, we use our control-sample methodology to test whether the skewness of the returns distribution of short-horizon returns differs across pilot and control stocks.[16] Our results indicate no statistically significant impact of the pilot program on return skewness, measured at five-minute, thirty-minute, or one-day return intervals.

Second, we identify positive and negative price "spikes," or instances when extreme price moves are reversed shortly afterwards, and examine whether the frequency of positive and negative spikes differs across pilot and control stocks. We find that at a short (five-minute) horizon, pilot stocks tend to experience more price reversals than control stocks, but that this result is the same for negative and positive price reversals. At a thirty-minute horizon, we find no evidence that there are more price reversals for pilot stocks than control stocks.

[16] Bris, Goetzmann, and Zhu (2004), in a study of the effects of short sale regulations around the world, find evidence suggesting that short selling constraints can affect the skewness of the returns distribution.

Third, we use a time-series regression methodology to measure the extent to which positive and negative price changes are likely to be subsequently reversed. If price rules play an important role in preventing short sellers from temporarily driving prices down below their fair value, we would expect to see a larger portion of negative returns subsequently reversed for the pilot stocks than the control stocks. For Listed Stocks, we find that a larger portion of both negative and positive returns are subsequently reversed for pilot stocks than control stocks at a short (five-minute) horizon. The symmetry of these results is consistent with the increase in volatility discussed above rather than any marked increase in the potential for downward price pressure. On the other hand, a marked increase in the potential for downward price pressure relative to upward price pressure should lead to an asymmetry in positive and negative return reversal results. We do not find this asymmetry. At a thirty-minute horizon, we find no statistically significant difference in the magnitude of return reversals for Listed pilot and control stocks. For Nasdaq NM Stocks, we find no statistically significant difference in the magnitude of return reversals for pilot and control stocks for either five-minute or thirty-minute intervals.

One important element of the Pilot is the ability to examine whether the tick test affects stocks of varying sizes and volume differently. For example, does the tick test affect larger stocks in the same manner as smaller stocks and would the tick test be more effective for large or small stocks? To examine these questions, we divide the stocks into size, measured as market capitalization, and volume, measured as trading volume divided by shares outstanding (turnover), groups and run each of our tests again for each group. For most of our tests, we find that the tick and bid tests affect stocks the same no matter how large or small or how active are the stocks. In particular, we find that the tick and bid tests result in a lower percentage of short sale volume for most size and activity levels. We also find that the tick and bid tests result in

lower bid and ask depth for most size and activity levels. Thus, the bid and tick tests do not affect liquidity in a way related to the size or activity level of a stock. Finally, the tick and bid tests do not affect returns at or following the start of the Pilot whether the stocks are large or small. On the other hand, the size and activity levels appear to matter for the effect of price restrictions on volatility and for routing decisions. The bid test affects routing decisions more in smaller stocks. Likewise, the bid and tick tests dampen permanent price volatility in small stocks while amplifying it in large stocks.

The remainder of this report is organized as follows. In section II, we recount the history of price restrictions, including Regulation SHO. Section III contains an overview of the academic literature relating to the tick test and the bid test. The data and construction of the samples are described in section IV. Section V explains the empirical methods used in the analyses. In section VI, we present our main analysis of the effect of removing price restrictions for pilot and control stocks over the first 6 months of the Pilot Period. More specifically, in section VI-A, we present our analyses of how eliminating price restrictions has affected the overall level of short volume and short interest, option market volume and open interest, and the frequency and duration of upticks or upbids within the day. In section VI-B, we present our analysis of how the removal of price restrictions has affected market quality, including measures of spreads and intraday volatility. In section VI-C, we report our results on whether lifting price restrictions has affected underlying stock prices or returns, the skewness of returns distributions, the incidence of positive and negative spikes, and the tendency of positive and negative shocks to subsequently reverse. In section VII, we investigate whether price restrictions affect all stocks similarly or whether certain types of stocks, such as small stocks, are more affected by the rules. Section VIII summarizes and concludes the report.

II History of Price Restrictions

This section briefly summarizes the historical background of the price restriction rules.[17] After the market crash of 1929, a popular view emerged that short sellers exacerbated the crash.[18] Public concerns about short selling became particularly acute in the aftermath of the international currency crisis of September 21-22, 1931, prompting Senator Arthur Capper of Kansas to introduce several bills aimed at restricting and taxing short selling. It was in this environment, on October 6, 1931, that the NYSE required that all sell orders must be marked long or short.[19] According to Meeker (1932, p. 147), this effectively acted as a rule against shorting on a downtick, as such trades were viewed as violations of the Exchange's rule against "demoralizing" trades.[20]

Shortly after its creation in 1934, the Commission recommended sixteen rules that all national securities exchanges should adopt. Among them was a recommendation for an explicit rule against shorting on a downtick:

> No member shall use any facility of time exchange to effect on the exchange a short sale of any security in the unit of trading at a price below the last sale price of such security on the exchange.[21]

Exceptions were specified for odd-lot trading and to allow regional exchanges to bring their prices in line with the primary exchange. Sixteen exchanges adopted this rule in 1935.[22]

SEC_OEA_FCIC_001189

Following sharp price drops in the fall of 1937, the Commission performed a study of the transactions of 20 securities on the NYSE for the periods September 7-13 and October 18-23 of that year[23] and found that short sales constituted a significant portion of the transactions in the declining market. The Commission adopted new short-selling rules, including a rule to formally define what is meant by a short sale and Rule 10a-1, the tick test.[24] This version of the tick test prohibited short sales "at or below the price at which the last sale, regular way, was effected on such exchange." The rule was adopted on January 24, 1938 and went into effect February 8, 1938.

The tick test was amended March 10, 1939 to allow for short selling at a zero uptick, or in other words at the last trade price, "provided that the last sale price was higher than the last different price which preceded it."[25] Certain exemption letters have been granted over the years, such as the exemption for diversified exchange traded funds.[26] However, the basic structure of this rule has remained essentially unchanged since 1939.

The Commission's Special Study (1963) identified three objectives of the tick test, which have been consistently used by the Commission as a framework for discussing the effectiveness of the regulation. These objectives are that the rule should:

(1) Allow relatively unrestricted short sales in an advancing market;
(2) Prevent short selling at successively lower prices, thus eliminating short selling as a tool for driving the market down; and
(3) Prevent short sellers from accelerating a declining market by exhausting all remaining bids at one price level, causing successively lower prices to be established by long sellers.

SEC_OEA_FCIC_001190

In 1976, the Commission proposed three alternative temporary rules that would have suspended the tick test for some or all registered securities.[27] In response to the proposal, several market participants, including the NYSE, opposed the proposal, and expressed concerns that abolishing the tick test might lead to increased volatility or decreased liquidity. The Commission withdrew the proposals in 1980.[28]

A House Report submitted by the Committee on Government Operations dated December 6, 1991 discusses several aspects of short selling, including the tick test.[29] The report suggests that short selling has negative price effects that "can have important and lasting consequences" and asserts that the tick test is "effective in stabilizing the market for exchange-listed stocks for the benefit of issuers and investors," although no evidence is cited in support of this view. The report also recommends that the tick test should be extended to the Nasdaq market.

On September 6, 1994, the Commission approved NASD Rule 3350 (the "bid test") as a temporary rule.[30] This created a bid test for trades executed by NASD members or their customers, but with exemptions for both equity and option market makers. Specifically, this rule prohibited short sales at or below (or less than one penny above) the best bid price whenever the prevailing inside bid price is lower than the previous inside bid. The bid test might appear less restrictive than the tick test, because it allows for unrestricted short selling at any price when the bid price is higher than the previous bid, and because of the market maker exemptions. Since its

initial approval, the bid test has been re-approved annually as a temporary rule.[31] The bid test was in effect when Regulation SHO became effective in January 2005. When Nasdaq began operating as an exchange in August 2006, NASD Rule 3350 was replaced by Nasdaq Rule 3350 and NASD Rule 5100.[32]

The Commission re-opened the discussion on Rule 10a-1 in a concept release dated October 20, 1999.[33] In this release, the Commission requested comment on numerous issues surrounding the tick test, including:

- whether the tick test should be suspended when the daily stock return is above a threshold level;
- whether actively traded securities should be exempted from the tick test;
- whether the restrictions should apply only around certain market events such as at the open and close, around mergers and acquisitions, or at option expirations;
- whether hedging transactions be exempt from the tick test;
- whether the tick test should be revised in response to expanded after-hours trading or decimalization;
- whether the tick test should be extended to non-exchange-listed stocks; and,
- whether the tick test should be eliminated.

In October 2003, the Commission proposed a rule that would create a uniform bid test that would apply to both Listed and Nasdaq NM Stocks, with various exemptions.[34] In addition, the Commission proposed a pilot program that would suspend the tick test for actively-traded securities for two years.[35] As stated in the proposing release, "[t]he temporary suspension would allow the Commission to study the effects of relatively unrestricted short selling on market volatility, price efficiency, and liquidity."[36]

SEC_OEA_FCIC_001192

With the adoption of Regulation SHO in July 2004, the Commission decided to defer consideration of the uniform bid test and the proposed exemptions (proposed Rule 201), in order to first observe the results of the pilot program.[37] In connection with the establishment of a Pilot, the parameters governing a Pilot were expanded to include a broader spectrum of securities than envisioned in the proposing release, and the length of the Pilot was shortened to one year. As stated in the adopting release,

> the purpose of the Pilot is to assist the Commission in considering alternatives, such as: (1) eliminating a Commission-mandated price test for an appropriate group of securities, which may be all securities; (2) adopting a uniform bid test, and any exceptions, with the possibility of extending a uniform bid test to securities for which there is currently no price test; or (3) leaving in place the current price restrictions.

The details of the program, including the list of securities included in the Pilot, were specified in the Commission's Pilot Order of July 28, 2004.[38] The Pilot was originally scheduled to begin on January 3, 2005 and last for one year. However, because the industry needed more time to prepare their systems, the start date was postponed until May 2, 2005, and later, the terminal date of the Pilot was extended until August 6, 2007 to maintain the status quo for pilot stocks until the Commission evaluates the results of the study and considers potential rulemaking on price restrictions.[39] The Pilot Order suspends Rule 10a-1 and the bid test for approximately a third of the Russell 3000 stocks. The methodology for selecting the pilot stocks is detailed in the Pilot Order, and is summarized in section IV, below.

III Previous Evidence

The previous evidence on price restrictions gives us insight into how price restrictions work. In particular, it examines the effectiveness of the rules and the effect that the rules have on

[37] SEC Release No. 34-50103, July 28, 2004.
[38] SEC Release No. 34-50104, July 28, 2004.
[39] SEC Release No. 34-53684, April 20, 2006.

market quality. We are unaware of a previous study that compares the tick test to the bid test. Several concurrent studies also examine the effect of the Pilot on the tick and bid tests (Alexander and Peterson (2006), Diether, Lee, and Werner (2006), and Wu (2006)). These studies are summarized on Appendix A.

A. Effectiveness of the Rule

1. Shorting in a Declining Market

Several studies examine whether the rules appear to keep short sales from executing in declining markets. When Rule 10a-1 was adopted in 1938, it was motivated in part by a Commission study of short selling, based on two weeks of data in 1937. This study found that when a downtick rule applied, a substantial amount of short selling occurred during periods when the market was declining.[40] Two subsequent studies produced by staff at the Commission found that the tick test allows short selling in declining markets.[41] The Commission's 1963 Special Study concluded that Rule 10a-1 was not effective at achieving its objectives, stating that

> [p]resent rules appear inadequate to relieve the added pressure that short selling may create during a severe decline in the general market or a declining price trend in a particular security. Despite the rules, a relatively large volume of short selling occurred in particular stocks, including "market leaders" and "trading favorites," during the period of decline preceding the market break of May 28, 1962, and at critical junctures on that day, and many additional opportunities existed when short selling could have occurred.[42]

In a more recent study, Ferri, Christophe, and Angel (2004) examine short selling in a matched sample of Nasdaq National Market stocks, which were subject to the bid test, and Nasdaq SmallCap stocks, which were not, during a period of high volatility and rapidly declining

[40] The NYSE had a downtick rule prior to the Commission's tick test. A downtick rule is a weaker form of the tick test because it allows trading at the most recent price even if that price was a downtick.
[41] The Securities and Exchange Commission (1963), in the Special Study, examined the trading activity leading up to and during the market break of May 28, 1962. In a working paper by SEC staff, Marcotte and Martin (1977) study the tick test for the period from September 20 through October 15, 1976, during which time the Dow Jones Industrial Average fell by 8.12%. The results are summarized in Pollack (1986).
[42] 88th Congress, HR Doc No 88-95 (1st session, 1963), pp. 293-294.

stock prices (September 2000-August 2001). In their sample of 2,275 observations, they find no significant differences in the overall level of short selling, or the frequency of days with abnormally negative returns and abnormally high short selling.

Overall, the research above shows that short sales are executed in declining markets despite the application of the tick or bid tests. However, this does not mean that short sales are unaffected by the tick and bid tests. We discuss this further in the next section.

2. Short Sale Execution Quality

Another area of research examines whether these rules harm the execution quality of short sales by reducing the prices received by short sellers, by delaying the execution of short sales, or by reducing the fill rates.

Martin and Marquette (1977) conduct a simulation calibrated to the Dow 30 stocks, to estimate the degree to which the rule would have affected execution prices for market short sale orders submitted during this period of market decline. The simulation results indicate that even during this period of rapid price declines, randomly arriving short market orders would have executed at higher prices as a result of the uptick rule. Therefore, short sellers appear better off because of the tick test.

Albert, Smaby, and Robison (1997) examine the negative abnormal returns to stocks following large increases in reported short interest, as an estimate of the profitability of short selling. They find that short selling was more profitable for their Listed sample than their Nasdaq sample during a period (1987-1991) when only Listed Stocks were subject to a price restriction. Their findings imply that the uptick rule does not have a significant impact on the bottom line for short sellers.

While studying order data from the NYSE, Angel (1997) and Alexander and Peterson (1999) find that the tick test prevents short sales from demanding liquidity more than 90% of the time. As expected, the degree to which the tick test is binding depends on whether the market is rising or falling. Likewise, McCormick and Reilly (1996) find that the Nasdaq bid test prevents short sellers from demanding liquidity roughly 35% of the time. This proportion was found to be an increasing function of trading volume and, not surprisingly, a decreasing function of the day's stock return.

Both Angel (1997) and Alexander and Peterson (1999) conclude that Rule 10a-1 significantly impedes order execution quality for short sales, even in rising markets. For those cases where the stock price increased, short sellers can trade at the bid less than fifteen percent of the time. According to Alexander and Peterson (1999), the tick test appears to contradict the Commission's first stated objective for short selling regulation, to "allow relatively unrestricted short selling in an advancing market."

In addition, Alexander and Peterson (1999) also found that short sale orders have significantly lower execution rates and significantly longer times to execution than regular sales. Alexander and Peterson (2002) study how the tick test was affected by the reduction of the tick size from 1/8 to 1/16 in June 1997. As predicted, their evidence suggests that short sales were executed faster and at better prices after the reduction in tick size, confirming that the tick test is less binding when the tick size is smaller.

In summary, previous research shows that short sellers can receive better prices as a result of the tick test and that the tick test does not impede profit opportunities. However, the tick test and bid test restrict the ability of short sellers to demand liquidity even in rising markets.

This results in execution delays and lower fill rates. Tick size changes have lowered these costs, but short sellers are still precluded from demanding liquidity much of the time.

3. Manipulation

Many of the studies that examine the ability to short in a declining market do not address the question of whether short selling in a declining market increases the potential for manipulating a stock price below its fair value, or conversely, whether short selling helps prices adjust more quickly to their efficient values. Nor do the studies address the question of whether a tick test or bid test would have been effective at reducing the amount of short selling during declining markets. A few early studies of short selling in the 1930s concluded that there was no evidence that short sales had any material effect on the magnitude of price swings.[43]

Ferri, Christophe, and Angel (2004) come a little closer to questioning whether the bid test inhibits trading that may be indicative of manipulation. On days when stock prices are declining, the degree of short selling is positively related to returns for Nasdaq SmallCap stocks, which are not subject to the bid test, but not for matching Nasdaq NM stocks, which are subject to the bid test. This result is the reverse of what one would expect to see if the bid test helps prevent short sellers from pushing down prices. The authors conclude that "a bid test is unnecessary for investor protection."

B. Effect on Market Quality

Because the tick and bid tests appear to have some impact on the execution of short sales, even though short sales can still execute in declining markets, we might expect the tick and bid test to affect market quality. In a recent working paper, Jones (2003) re-examines the period surrounding the initiation of the tick test in the 1930s. He finds a significant reduction in bid ask

[43] See Twentieth Century Fund (1935), Macaulay and Durand (1951).

spreads and positive abnormal stock returns surrounding the initiation of the downtick rule on October 6, 1931, with no significant changes in trading volume, volatility, or the price impact of trades. He also finds similar results surrounding the initiation of Rule 10a-1 1938. He concludes that

> [b]ecause the uptick rule no longer constrains shorting as much as it once did, any liquidity effects are likely to be much more modest than the ones identified in the 1930's. However, it would not be surprising if repeal of the uptick rule were to lead to some reduction in individual stock liquidity, particularly in less liquid stocks.[44]

In research sponsored by NASD, McCormick and Reilly (1996) find that the introduction of the bid test did not have a substantive impact on market quality, as measured by volatility and bid ask spreads. A more comprehensive follow-up study by McCormick and Zeigler (1997), which was also sponsored by the NASD, supports the original finding that the implementation of the bid test had little or no impact on market quality. They find that quoted and effective spreads were narrower in 1997 than in 1994, but they attribute the changes to a gradual improvement in market quality over time, and not to the implementation of the bid test. They find no significant change in quoted spreads as a result of the bid test. While they do find a statistically significant decline in effective spreads, this is a natural consequence of a rule that forces short sellers to act as liquidity suppliers rather than liquidity demanders. Because the improvement in effective spreads is coming at the cost of delayed executions, it does not necessarily signify an improvement in market quality.

Au-Yeung and Gannon (2003) estimate the joint dynamics of index and index futures returns in Hong Kong, surrounding the elimination of Hong Kong's uptick rule on March 25, 1996. Using a multivariate GARCH framework, they find evidence that Hong Kong's uptick

[44] This study was funded by the New York Stock Exchange.

rule was impeding price discovery on the index relative to the futures contract, and that conditional volatility for the index declined with the elimination of the uptick rule.

Overall, this evidence seems to indicate that tick tests can lead to narrower bid ask spreads, but impedes price discovery, while the bid test should not have any discernable effect on market quality. The construction of the Pilot study improves upon the design of these previous studies and allows us to study these issues in a more controlled environment.

IV Construction of the Samples

A. Selection of Pilot and Control Stocks

The stocks in the pilot sample are those specified in the Pilot Order.[45] Stocks were selected for this sample by sorting the 2004 Russell 3000 first by listing market and then by average daily dollar volume from June 2003 through May 2004, and then within each listing market, selecting every third company starting with the second. Because the selection process relied on average daily dollar volume, companies that had their initial public offering in May or June of 2004, just prior to the Russell reconstitution, were not included. The 32 stocks that are not listed on the NYSE, Amex, or Nasdaq NM were also excluded prior to sorting and selecting the pilot stocks.

While no companies have moved in and out of the Pilot, the pilot stocks might experience ticker symbol changes, listing changes, and mergers. We collected the necessary change information from NYSE, Amex, and Nasdaq, who keep track of and disseminate these changes. In the case of mergers between pilot and control stocks, the status of the resulting company is the same as the status of the company with the larger market capitalization of equity on the day prior to the first merger announcement. The pilot stocks that did not survive to the start of the Pilot on

[45] SEC Release No. 34-50104, July 28, 2004.

May 2, 2005 are not included in the analysis. Pilot stocks with listing changes during the Pilot are included in our analysis up until the date of the listing change even though they are still in the Pilot..

The stocks in the control sample come from the remainder of the 2004 Russell 3000 not included in the Pilot. We do not include the stocks with initial public offerings after May 2004 because these stocks were not eligible to be selected for the Pilot. Like the pilot sample, the control sample stocks can experience corporate events that make tracking them difficult. We keep track of ticker symbol changes, listing changes, and mergers using the daily symbol directories from the Nasdaq Trader web site and using Bloomberg. As with the pilot sample, we include only the control stocks that survive until May 2, 2005 and include stocks that are subsequently delisted up until the delisting date.

Table 1 reports the sample sizes and breaks down the sample in various dimensions. As the table indicates, our sample contains 504 listed pilot stocks and 973 listed control stocks that are subject to Rule 10a-1 and 439 Nasdaq pilot stocks and 917 Nasdaq control stocks that are subject to NASD Rule 3350. Table 1 also indicates that roughly 70% of Listed Stocks and 63% of Nasdaq NM Stocks have listed options. Because listing affects the short sale rules applied to trading, we report results for each of these sub-samples but not for the full sample. If an issuer switches its listing from Nasdaq to Amex or NYSE or vice versa after May 2, we keep that stock in the sample up until the day of the listing change. If an issuer changed its listing prior to May 2, it will be grouped according to its new listing and we include pre-period data only from that same listing.[46] Listings changes between Amex and NYSE do not affect our sample because the change does not affect the short sale rule applied.

[46] We exclude one stock that changed its listing on the first day of the pilot, Renasant Corporation RNST, formerly Peoples Holding Company, PHC.

Similarly, we keep stocks in our sample up until their last listed day even if they are acquired or otherwise move to markets that do not apply the same rule (i.e., move to the Nasdaq Capital Market, OTCBB, or the Pink Sheets) after May 2, 2005. We keep these stocks to avoid a survivorship bias, which is a bias associated with finding higher average returns than actually exist. We believe an analysis of the pilot would be particularly sensitive to survivorship bias and we therefore, make every effort to reduce it. Further, if an issuer moves its listing from Nasdaq to an exchange or from an exchange to Nasdaq, we keep the stock in the sample up until the list/delist date. We do this so that our analysis does not confuse the effects of the tick test with those of the bid test. Because we retain stocks in our sample until the stocks delist, our sample size on our last sample day (October 31, 2005) is smaller than our sample size on the first pilot day (May 2, 2005). In fact, we have about 88 fewer stocks in our sample on October 31 than we do on May 2. Despite the drop in sample size, the pilot stocks comprise about 1/3 of the sample stocks for both Listed and Nasdaq NM Stocks on October 31 as well as May 2.

B. Data and Sample Statistics

We examine these pilot and control stocks over a 210 day period in 2005. We examine the 82 day period from January 29 to April 29 as the Pre-Pilot Period during which the pilot and control stocks are subject to the same rules. The Pre-Pilot Period allows us to test whether the pilot and control stocks appear similar when they are subject to the same rule and it gives us a reference point to examine how the sample stocks change when the price restriction rules are removed. In the results section, this period is compared to the 128 day period from May 2, the first day of the pilot, to October 31, 2005.

Before comparing the Pre-Pilot Period to the Pilot Period, we first examine whether the pilot and control samples appear comparable over the Pre-Pilot Period. Table 2 gives this comparison separately for Listed and Nasdaq NM Stocks. The statistics are daily levels averaged over the Pre-Pilot Period. We use trade and quote data obtained from the Securities Industry Automation Corporation (SIAC) to estimate stock volume, price, spread, depth, and intraday returns, data from the Center for Research in Securities Prices (CRSP) to estimate market capitalization and daily returns, data from the Option Price Reporting Authority (OPRA) to estimate option volume and open interest, and the SRO Pilot data to estimate short selling levels.[47] Short interest, reported monthly, comes from the NYSE, Amex, and Nasdaq. Most of the measures in Table 2 are qualitatively similar for pilot and control stocks, according to a statistical t-test run at the 95% and 99% confidence levels (also stated as 5% and 1% significance levels). This evidence suggests that the two groups are a good match and supports the validity of further comparison of pilot and control stocks.

The statistics of Table 2 are divided into groups. The first group of statistics measures general stock characteristics such as volume, price, market capitalization, and short interest. The first three rows of Table 2 show that the pilot stocks have similar average volume to the control stocks whether volume is measured by the number of trades per day, the average daily share volume, or turnover. The average volume-weighted average price (VWAP) and average market capitalization diverge slightly. For both Listed and Nasdaq NM Stocks, the VWAP is higher for pilot stocks but the market capitalization is lower. Neither difference is statistically significant.

[47] The SRO Pilot data refers to the short selling records available from each of nine markets: American Stock Exchange, Archapelago Exchange (now a part of NYSE Group), Boston Stock Exchange, Chicago Stock Exchange, NASD, NASDAQ Stock Market (now NASDAQ Stock Exchange), New York Stock Exchange (now a part of NYSE Group), National Stock Exchange, and the Philadelphia Stock Exchange. This analysis aggregates the short selling data without regard to whether there exists a SIAC report for the short sale transaction.

The next group of statistics measures the level and nature of short selling. These statistics measure short interest, the short selling volume and location, and option volume and open interest. In Listed Stocks, short selling comprises about 24% of share volume and 27% of trades. The level jumps to 36% of share volume and 37% of trades in Nasdaq NM Stocks. Still, the level of short selling in pilot stocks is similar to that of control stocks prior to the start of the pilot. Because the bid test does not apply to all markets, we examine the share of short sales executed on Nasdaq to measure whether investors appear to be routing short sales away from Nasdaq. While we estimate this statistic for Listed Stocks as well, we focus on the Nasdaq NM Stocks for results. Rows ten to fifteen of Table 2 show that prior to the pilot, the pilot and control stocks have similar average option volume and open interest, statistically indistinguishable from each other.

The next set of statistics measures mechanical aspects of trading and quoting, in particular, the percentage of trades occurring on a downtick or zero downtick and the percentage of the day during which the last change in the bid was downward. These measures were selected because they both determine when a short sale can be executed and are influenced by the application of the price restrictions. Prior to the pilot, about 46% of trades in Listed Stocks occur on downticks or zero downticks, while slightly over 50% of trades in Nasdaq NM Stocks do. These percentages are similar for the pilot and control stocks. Likewise, the percentage of the day during which the most recent change in the bid was downward is similar for pilot and control stocks. For Listed Stocks, the most recent change in the bid was downward for about 39% of the day. This is indicative of the nature of a limit order book market to have short-lived liquidity imbalances followed by long periods of liquidity building. In other words, a large order quickly executes, removing several price levels in the limit order book, followed by a slow replenishing

of the limit order book. In the Nasdaq market, which operates more like a dealer market than the listed market, stocks spend more time in a downbid situation, about 47% of the time.

Liquidity is the next important group of statistics. We measure displayed liquidity using quoted and effective spreads measured in absolute terms and also relative to prices, and using aggregated quoted ask and bid depth at the National Best Bid and Offer (NBBO). We measure realized liquidity using the NBBO for both Listed and Nasdaq NM Stocks. Like the earlier measures, the liquidity measures show that the pilot and control stocks are statistically similar for all measures. While the magnitude of some of the measures, particularly the quoted ask depth and quoted bid depth, appears higher for control stocks than for pilot stocks, the measures are actually statistically similar.

The final group of statistics gives the distribution of returns and prices over various periods. Table 2 gives average returns, average absolute returns, the skewness of the returns, and the variance of the returns over 5 minute, 30 minute, and 1 day periods. It also shows the daily price range and three variance ratios. The variance ratios measure the transitory volatility by comparing the variance of returns measured over short and long horizons. Overall, the pilot and control samples are statistically similar in the means, skewness, and transitory and total volatility. It is interesting to note that the returns for all samples and all horizons are positively skewed. This positive skewness has been documented in previous work and is correlated with short selling restrictions.

V Methods

A. Comparing Pilot and Control Stocks

We derive the results in this report using several empirical approaches. The first approach compares the pilot sample to the control sample both before and after the start of the pilot. The approach allows us to apply a standard t-test to the difference of the differences. As long as the pilot and control samples are generally well constructed, this approach will control for changes in market conditions that are unrelated to the pilot. However, this approach may not fully control for differences within the samples. Further, it is cumbersome when examining the differential effect of the pilot on sub-samples. Therefore, we will also employ a regression approach.

The regression approach includes multiple test variables at the same time and also controls for unforeseen differences between the pilot and control samples. Because the number of stocks changes over the sample period, we employ daily cross-sectional regressions for each sample day after the start of the pilot and then we average the coefficients. We employ variations on the following regression:

$$\text{Market Quality}_i = \alpha + \beta_1 \text{Pilot}_i + \beta_2 \text{Pre Pilot Market Quality}_i \quad (1)$$

where Market Quality is one of several dependent variables (e.g., effective spread) measured for each stock on one trading day, Pilot is equal to one for pilot stocks and zero for other stocks, and Pre-Pilot Market Quality is the average daily level of the dependent variable measured over the Pre-Pilot Period. If the dependent variable is generally larger for pilot stocks than control stocks, then β_1 will greater than zero. If this relation is persistent across time, then the average β_1 will be greater than zero. The Pre-Pilot Market Quality variable helps ensure that the coefficients on the

indicator variables measure the effect of removing price restrictions. It also helps to control for any unforeseen differences between the pilot and control stocks.

We run all tests separately for stocks listed on an exchange and stocks listed on Nasdaq NM because the rule applied to trading of Nasdaq NM Stocks is different than the rule applied to the trading of stocks listed on exchanges.[48] This allows us to satisfy one purpose of the Pilot, which is to clearly distinguish the effect of each type of rule.

B. *Behavior of Stock Prices Surrounding the Pilot Initiation*

In order to evaluate whether the tick test or the bid test affects the level of stock prices, we examine average daily returns and average cumulative returns for pilot and control stocks over a 21-day period surrounding the beginning of the pilot. If pilot stocks are over-valued because of the price restrictions these returns should be significantly negative for pilot stocks relative to the control stocks on or around the first day of the pilot. Cumulative returns are normalized to zero on April 29, the trading day prior to the start of the pilot.

We believe it likely that any valuation effects of the pilot that are not already impounded into the price before the start of the pilot would most likely be observed immediately upon the initiation of the pilot, and reflected in the returns on the first day. However, we also consider the possibility that the effects of the pilot might be manifest over a longer time period. Therefore, we also examine returns over a six month time horizon. To avoid a survivor bias, we compound returns to the six month horizon if a stock falls out of the sample prior to October 31, 2005. In addition, to control for the systematic risk of a stock, we estimate an alpha for each stock. We estimate these alphas in-sample using the market model:

[48] It is worth noting that neither the bid test nor tick test applies to the trading of Nasdaq NM stocks on exchanges.

$$R_t = \alpha + \beta R_{Mt}$$

where R_t is the return on the stock in day t, and R_{Mt} is the equally-weighted market index return from CRSP for that day. We also estimate the tendency of the alphas to be significantly positive or negative. Pilot stocks might be more likely to have negative alphas than control stocks if either price restrictions corrected over-pricing over long horizons or if price restrictions prevent constant short selling pressure from pushing prices below their equilibrium level. Pilot stocks might be less likely to have positive alphas if price restrictions facilitate over-pricing.

C. *Measuring Large Price Reversals*

As part of our analysis of whether price restrictions inhibit price patterns that may be indicative of short-term price manipulation, we wish to examine the frequency of large short-term price movements that are immediately reversed. Although such price reversals, or "spikes," are bound to occur with some frequency due to the natural variation of prices, they may also be a sign of price manipulation. If the price patterns indicative of manipulation are more prevalent on the short side than on the long side, we would expect to see more negative price spikes than positive ones. And if price restrictions are effective at reducing the potential for price manipulation, we might expect to see significantly more price spikes for pilot stocks than control stocks.

To investigate this, we define the following measures of short-term price reversals:

$$Negative: \min(-R_{t-1}, R_t^L) / \sigma_i$$
$$Positive: \min(-R_t^L, R_{t-1}) / \sigma_i$$

In these formulas, σ_i represents the holding period (non-annualized) standard deviation of returns on stock *i,* measured using data in the Pre-Pilot Period, R_t is the simple one-period return

on stock i at time t, and R_t^L is the one-period return measured as a percentage of the lagged stock price:

$$R_t = \frac{P_t - P_{t-1}}{P_{t-1}} \qquad R_t^L = \frac{P_t - P_{t-1}}{P_{t-2}},$$

where P_t represents the price of stock i at time t. We estimate these metrics using 5-minute and 30-minute horizons. The return as a percentage of the lagged price is used in the measure so that the adjacent returns will be compared on the same basis.[49]

We normalize the reversal measure by the standard deviation of returns on the same stock, computed using the same return interval over which the reversals are measured, in order to ensure that the measure will capture reversals that are large in magnitude compared to the typical movement on the stock. The standard deviation is computed using only pre-pilot returns data, so that the measure will not be affected by any changes in volatility that may be related to the pilot.

By definition, a "negative reversal" only occurs in periods when there is a negative return followed by a positive return—otherwise, the negative reversal measure is equal to zero. If a stock experienced a negative return of 3 standard deviations that was fully reversed in the next period, our negative reversal measure would be 3. If a return is only partially reversed, only the portion that is reversed is counted in the measure.

We do not test whether this measure changes across Pre-Pilot and Pilot Periods because the Pre-Pilot Period is already used to normalize the measure. Rather, we focus on differences between the control and pilot samples during the Pilot Period. In order to test whether the frequency of extreme reversals differs across the two samples, we use a nonparametric bootstrapping methodology that does not require any assumptions about the probability

[49] For example, if a stock price increases from 40 to 50 and then returns back to 40, this corresponds to a 25% return followed by a -20% return. In our measure, we would compute the negative return as a percentage of the original price, which would make it a -25% return.

distribution of returns or return reversals. Essentially, this method estimates the likelihood of observing a particular number of reversals under the null hypothesis that the distribution of reversals in the pilot sample is the same as the distribution in the control sample. This is implemented as follows. For a given "threshold" level of the reversals measure, we count the number of reversals in the pilot sample that exceed that threshold. We then select from the control sample (with replacement) a random sample of reversals equal in size to the pilot sample. Within this randomized sample, we count the number of reversals exceeding the threshold, and observe whether the number is higher or lower than the number observed in the pilot sample. We repeat the process 1,000 times and observe the frequency with which the number of reversals in the randomized control sample equals or exceeds the number in the pilot sample. We report the significance based on a two-tailed test—for example, the number of reversals in the pilot sample would be deemed significant at the five percent level if the a number that high occurs 2.5% of the time or less in randomized control samples.

D. *Autoregression Methodology for Measuring Reversals*

As an alternative approach to measuring the impact of the pilot on price reversals, we employ a new methodology. Similar in spirit to autoregression, this methodology involves measuring the extent to which positive and negative price movements reverse in subsequent periods. Specifically, we use intraday returns to estimate a model of the form:

$$R_t = \sum_{n=1}^{5} \alpha_n R_{t-n}^{-} + \sum_{n=1}^{5} \beta_n R_{t-n}^{+} .$$

In this equation, R_t represents the stock return in period t, and the regressors are the positive and negative components of lagged returns:

$$R_t^{-} = \min(0, R_t) \qquad R_t^{+} = \max(0, R_t) .$$

The estimated α and β coefficients measure the extent to which positive and negative returns tend to reverse or continue in subsequent periods. In a world where stock prices follow a random walk, the true coefficients would be equal to zero. Unlike an ordinary autoregression, this specification permits the degree of momentum or reversals to differ for positive and negative shocks. In either case, positive coefficients would indicate that returns exhibit short-term momentum, while a negative coefficient would indicate short-term reversals. For example, if the coefficients α_1 and α_2 were estimated to be -0.05 and -0.01, this would mean that a negative return of one percent would, on average, be followed by a positive return of five basis points in the next period, and a positive return of one basis point in the period after that. If the coefficients β_1 and β_2 were estimated to be -0.04 and -0.02, this would indicate that a positive return of one percent would on average be followed by negative returns of four and then two basis points in the next two periods. We are interested in comparing these coefficients for pilot and control stocks. If price restrictions help prevent short-term negative stock price manipulations, we would expect to see the α coefficients higher for pilot stocks than for control stocks.

E. Small and Low-Volume Stocks

One policy alternative outlined in the first Pilot Order was to extend a uniform test to all securities, including securities with a lower market capitalization or less actively traded than those included in the Pilot. While our analysis cannot directly investigate the effects of price restrictions for stocks beyond the range covered by the pilot sample, it can provide relevant evidence by investigating whether the impact of the Pilot has been substantially different for the smaller stocks than for the larger stocks in the Pilot, or whether the impact has differed for

actively traded and less actively traded issues. To examine these questions, we run a series of regression-based tests of the following form:

$$\text{Market Quality}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i + \beta_{11} \text{Pre Market Quality}_i$$

where "Market Quality" represents a characteristic of interest such as spreads, depth, or volatility. The "Decile" variables are indicator variables corresponding to each of the nine lowest deciles, for two different decile partitions. The first partition ranks stocks by market capitalization on April 28, 2005. The second partition ranks stocks by annualized turnover in the Pre-Pilot Period as measured by its average daily share volume divided by its shares outstanding as of April 28, 2005 and multiplied by 250. In each case, the decile indicators take on a value of one if the stock falls within the designated decile, and zero otherwise. These partitions allow us to test whether the price restrictions have a larger impact on certain categories of stocks. In particular, we examine each $\beta_{10} + \beta_k$ to measure whether the pilot has a significant effect on stocks in decile *k*.

VI Results and Analysis

A. The Nature of Short Selling

1. Short Selling Activity

Price restrictions may impose costs on short sellers in the form of lower fill rates and delays on execution. If these costs are economically significant, then we would expect the removal of the price restrictions to result in increased short selling. We would expect short selling to increase more for pilot stocks than control stocks if the price restrictions are costly, or be the same for the pilot and control stocks if price restrictions are not costly.

Table 3 shows how removing the price restrictions affects the level of short selling, based on three different measures, including (i) the number of shares sold short on a given day divided by the total share volume, (ii) the number of trades involving short sales, and (iii) short interest. Panel A shows the Pre-Pilot Period to Pilot Period comparison while Panel B reports the average coefficients from regression analysis. In the Listed market, short volume increases significantly from 24.4% to 26.3% of total volume in the pilot sample, while the change is not statistically significant for the control sample. A comparison of these two changes reveals that short selling volume increases by about 2% of total volume as a result of removing the tick test, suggesting that the tick test imposes economic costs on short sellers. The same conclusion can be drawn from the statistics on short selling as a percentage of trades.

Similarly, both volume and trade measures for Nasdaq NM Stocks suggest that the application of the bid test reduces short selling. The regression analysis in Panel B confirms these conclusions and also shows that the effect of the tick test is stronger than the effect of the bid test.

Although our results indicate that price restrictions appear to constrain the volume and frequency of short sales, these effects are not reflected in short interest. As indicated in Table 3, both pilot and control stocks exhibited significant increases in short interest around the time of the Pilot Period. However, none of the tests indicate any significant difference between pilot and control stocks. Both the univariate results in Panel A and the regression-based results in Panel B lead to the same conclusion: price restrictions appear to have no effect on short interest for Listed Stocks or for Nasdaq NM Stocks. The same result is observed whether short interest is measured in percentage of shares outstanding or in "days to cover."

The fact that we document statistically significant increases in short selling volume but not in short interest can be interpreted in various ways. One interpretation is that the increase in short volume is due primarily to increased short selling by parties that close out their short positions within the day—or, more generally, that the increase in short volume was accompanied by a decrease in the average horizon over which short positions are held. We should also note that the absence of a statistically significant result does not imply that no change occurred. Given that we observe short interest only monthly, it is possible that our statistical test did not have sufficient power to detect a change in short interest.

Because short sales in Nasdaq NM Stocks executed outside of the Nasdaq market are not subject to the bid test, short sellers can avoid the bid test by sending orders to markets other than Nasdaq. The removal of the bid test might result in an increase in short sales on Nasdaq in Nasdaq NM Stocks because the order routing decision might no longer be affected by the application of the bid test. The Nasdaq market share statistics in Panel A of Table 3 show that Nasdaq's market share in short sales increased 3.9% in pilot stocks and by 1.3% in non-pilot stocks. The difference of 2.6% is statistically significant, which is consistent with the non-uniform application of the bid test altering order routing decisions.

2. Option Activity

If price restrictions drive short sellers to trade options in lieu of stocks, then their removal should decrease option activity. Table 4 summarizes the changes in option trading for pilot and control stocks between the Pre-Pilot Period and Pilot Period. There are a total of 628 pilot and 1,263 control stocks that had listed options included in the analysis. Put and call option trading volume is aggregated over all classes and markets for each underlying stock on a daily basis.

Then, the put and call option trading volume is averaged across days for each stock for period before the pilot and for the period of the pilot. The change in put option trading volume is calculated as the average daily put (call) volume during the pilot minus the average daily put (call) volume before the pilot. Finally, the change is averaged across stocks to yield the results reported in Table 4. Averaging across stocks allows us to maintain the independence of the observations and perform a t-test comparing the mean of the pilot stocks to the mean of the control stocks. The results for open interest and signed option volume use the same methodology.

If the price restriction drives would-be stock short sellers to trade options to implement their investment strategies, then the lifting of the price restrictions on the pilot stocks would lead to a significant decline in option trading for pilot stocks relative to the control stocks. As indicated in table 4, between the Pre-Pilot Period and Pilot Period, we do observe a slight increase in average trading volume for calls and puts on Listed Stocks, a decrease in average trading volume of calls and puts on Nasdaq NM Stocks, and an increase the average open interest of all categories. Based on the paired *t* test, however, we find no statistically significant changes at the 5% confidence level. We also observe that open interest increased less on average for control stocks than for pilot stocks, but again, based on the two-sample *t* test, we find no statistically significant differences between the changes in the pilot and control samples.

As an additional measure, we examine signed option volume. This is computed by subtracting the change in the put volume from the change in the call volume. A positive signed option volume suggests either an increase in long side buyer speculation or a decrease in short side seller speculation. A negative signed option volume suggests either a decrease in long side buyer speculation or an increase in short side seller speculation. For example, if the change in

the call volume is -10 and the change in the put volume is -5, then the signed option volume equals -5. On the other hand, if the change in the call volume is -5 and the change in the put volume is -10, then the signed option volume is 5. Again, we find no significant difference between pilot and control stocks.

Since short sellers may use short-term options in lieu of equity short sales, Table 4, Panel B shows the results for short-term options only.[50] The results are quantitatively similar to the results in Table 4, Panel A. Thus, the conclusions drawn from Table 4, Panel A hold for short-term options.

Overall, the options market results provide no statistical evidence supporting the hypothesis that the tick test drives would-be short sellers away from the equity markets and to the options markets to trade.[51] Option trading volume of pilot Nasdaq NM Stocks show a decline in option volume relative to control stocks of 15%, but this difference is not statistically significant.

3. Mechanical Effects

Price restrictions have the mechanical effect of forcing short sellers to be liquidity suppliers instead of liquidity demanders because short sales can rarely be executed against the bid price. Therefore, we expect the removal of price restrictions to be associated with changes in quoting and trading purely because of the mechanics of the rules. In particular, Table 2 shows that about 46% of trades occur on downticks when the tick test applies. We expect that the removal of the tick test will lead to more balanced trading around 50% downticks because short

[50] Long and short-term options are identified using the Options Clearing Corporation directory as of October 31, 2005.

[51] A regression model that controlled for changes in volatility in the pre- and post-periods provided results that were consistent with those in Table 4.

sales can now execute on downticks. This effect should be more obvious in Listed Stocks than Nasdaq NM Stocks where the trades occur on downticks half the time even with the bid test.

A second potential mechanical effect is the percentage of time during the day when the most recent bid change was downward. Table 2 shows that this figure is around 39% when the tick test applies and 47% when the bid test applies. Removing either price restriction could increase the percentage of the day with down bids because short sales can more easily hit the bid to force more downbids. Conversely, if the different price restrictions can explain some of the divergence in these figures, we expect the percentage of downbids in Listed Stocks and Nasdaq NM Stocks to converge.

Table 5 shows how the tick and bid tests affect trading and quoting mechanics. The downtick rows in Panel A show that the percentage of trades on downticks increases from 46% to almost 50% in pilot Listed Stocks. Conversely, the percentage of trades on downticks in control Listed Stocks goes down. On net, the percentage of trades on downticks is fairly balanced when the tick test does not apply and is skewed toward upticks when the tick test does apply. Nasdaq NM Stocks appear to have much more balanced trading even with the bid test so that removing the bid test results smaller increase in the number of downticks. Panel B confirms the result that the tick test has a much larger effect on trading mechanics than the bid test.

The downbid rows in Table 5 measure the percentage of the trading day during which the most recent bid change was downward. Pilot Listed Stocks experience a small increase in the prevalence of downbids but this increase is roughly similar to an increase experienced by control Listed Stocks. The results show a decline in the prevalence of downbids for pilot Nasdaq NM Stocks, suggesting that short selling under the bid test might shorten the duration of upbids, reflecting the restriction that short sales can only hit upbids.

B. Market Quality

1. Liquidity Measures

Because price restrictions alter how orders transact with each other, they have the potential to alter traditional measures of liquidity. In particular, the price restrictions will often keep a short sale from executing against the bid quote. Therefore, we expect the depth at the bid quote to be lower without price restrictions. If a short sale can not execute against the bid, it often adds depth to the ask quote, and hence, the depth of the ask might be lower without price restrictions. Alternatively, a restricted short sale might set a lower ask price and an unrestricted short sale might exhaust the depth at the bid resulting in a lower bid price. Either way, short sale price restrictions can result in a narrower quoted bid-ask spread.

While quoted spreads and depths measure the displayed supply of liquidity, the effective spread measures liquidity actually available to investors. Therefore, an examination of effective spreads is necessary to understand the effect of price restrictions on liquidity. Because price restrictions can affect the displayed liquidity, we might also expect them to affect the actual liquidity as well.

Table 6 shows results on the effect of price restrictions on liquidity. For the pilot sample, the ask depth decreases for Listed Stocks but increases for Nasdaq NM Stocks. The control sample experiences an increase in depth at the ask. Comparing the changes reveals that the ask depth of the pilot stocks decreased relative to the ask depth for the control stocks in both Listed and Nasdaq NM Stocks. This change is significant for Listed Stocks in both the univariate and regression-based tests, but is significant for Nasdaq NM Stocks only in the regression-based tests

in Panel B. Panel B also shows that the ask depth is augmented about three round lots more when a tick test applies than when a bid test applies.

The bid depth results in Table 6 are slightly different than the ask depth results. The bid depth increases for all sub-samples, but the difference between the pilot and control samples is not significant in Panel A, while Panel B suggests that the bid depth of the pilot stocks does not increase as much as the bid depth of the control stocks. This effect is larger for Nasdaq NM Stocks than for Listed Stocks, therefore, the bid test seems to augment the bid depth more than the tick test does by about one round lot.

We examine two measures of quoted spread. The first, known as the "absolute spread," is simply the difference between the ask price and the bid price, measured in pennies. The second, called the "relative spread," is the absolute spread divided by the bid-ask midpoint, thus measuring the displayed cost to trade as a percentage of the stock's value. Panel A shows that the quoted spreads did not change much when the pilot started for either the pilot stocks or the control stocks. Only the relative quoted spread in control stocks saw an increase but that increase was not statistically different from the change in relative spreads experienced by the pilot stocks. The conclusions from Panel B give a more mixed picture. Quoted spreads decline about 0.3 cents more for pilot stocks, a result that is the same for Listed Stocks and Nasdaq NM Stocks. This result suggests that the tick and bid tests appear to reduce liquidity. However, the results on relative quoted spreads yield the opposite conclusion. While these results are statistically significant, the point estimates are fairly small. The quoted spreads decline by less than half a penny and the relative quoted spread increases by less than a basis point. Taken together, these results suggest that the tick and bid tests have a slight effect on quoted spreads, if any.

In addition to quoted spreads we also examine effective spreads, estimated for each trade by computing the absolute value of the difference between execution price and the current bid-ask quote midpoint. As we did for the quoted spread, we estimate both absolute and relative effective spreads. The effective spread results in Panel A of Table 6 look quite similar to the quoted spread results. Only one of the changes is statistically significant, a decline in the effective spread of pilot Nasdaq NM Stocks. This result alone would suggest that the application of the bid test decreases liquidity. However, this conclusion is weakened by the lack of statistical significance in the other sub-samples and the lack of a difference between the pilot and control stocks. The Panel B results suggest that the tick test has no impact on effective spreads, but the results on the bid test are mixed. The bid test appears to decrease effective spreads and increase relative effective spreads. Like the results on quoted spreads, the magnitudes of these changes are small.

Overall, the Regulation SHO Pilot shows us that the price restrictions appear to augment depth at both the ask price and the bid price, but price restrictions have little if any effect on realized liquidity. These results are fairly consistent whether the price restriction is structured as a tick test or as a bid test, although the tick test augments the ask depth more and the bid test augments the bid depth more.

2. Return Volatility

The next set of tests examine whether removing the price restrictions alters return volatility. Table 7 displays test results for several volatility measures and several return horizons to capture different aspects of volatility.

The daily price range measures the degree to which prices fluctuate within a day by comparing the high price to the low price in a day. The daily price range declines from the Pre-Pilot Period to the Pilot Period for each subsample. This decline is statistically significant for both Listed and Nasdaq control samples and for the Nasdaq pilot sample, but not for the Listed pilot sample. Panel A suggests that the decline was statistically similar for pilot and control stocks, while the Panel B regression suggests that the daily price range increased for pilot stocks relative to control stocks for both the Listed and Nasdaq samples. Taken together, the daily price range results are mixed on whether the tick and bid tests dampen volatility.

To explore intraday volatility further, we examine our next two volatility measures, absolute returns and return variance, over three time horizons, 5 minutes, 30 minutes, and one day.[52] These measures would increase for pilot stocks over the shorter horizons if the tick and bid tests dampen transitory volatility. The measures would increase for the pilot stocks over the longer horizons if the tick and bid tests dampen permanent volatility. Economically, transitory volatility captures the efficiency of the trading mechanism while permanent volatility captures the effects on equilibrium prices. We separately analyze absolute returns and return variance because each measures volatility slightly differently. Return variance has a tendency to put more weight on larger price movements than absolute returns.

The average absolute returns are lower during the Pilot Period for the control sample across all three return horizons. The univariate results in Panel A show that the pilot stocks experienced a statistically similar decline in the absolute returns as the control stocks for the 30 minute and daily horizons. At the five-minute horizon, however, the pilot sample experienced an increase in absolute returns relative to the control stocks for both Listed and Nasdaq NM Stocks.

[52] The 5 and 30 minute absolute returns and variances are estimated without including the first half hour of the trading day, after hours trading, or pre-open trading.

The regression results in Panel B confirm this finding and shows that the effect is larger for Listed Stocks. Panel B also confirms the results for the daily horizon but indicates that absolute returns increased over the 30-minute horizon for pilot stocks relative to control stocks. While the 30-minute results are mixed, the absolute return results suggest that the tick and bid tests have no effect on the magnitude of daily returns while they seem to dampen the magnitude of five minute returns. Further, the tick test seems to dampen short-term returns more than the bid test.

The return variance results in Panels A and B are quite a bit weaker. Panel A shows that the changes to return variances experienced by pilot stocks are statistically similar to the changes in return variances experienced by control stocks for both Listed Stocks and Nasdaq NM Stocks, and this result holds for all three return horizons. Panel B confirms this result for the 30 minute and daily return horizons but finds that pilot Listed Stocks seem to experience an increase in return volatility over the 5 minute horizon relative to control Listed Stocks. In summary, the bid test seems to have no effect on return variance over any time horizon while the tick test might dampen return variance over the five minute horizon.

Because the results above suggest that price restrictions may dampen transitory volatility, we next focus on variance ratios that are specifically designed to capture transitory volatility by comparing the short horizon volatility to longer horizon volatility. If no transitory volatility exists, variance ratios are designed to equal one. We examine three different variance ratios. We compare five minute variance to thirty minute variance, five minute variance to daily variance, and thirty minute variance to daily variance. Panels A and B show that the variance ratio of five to thirty minute returns increased for pilot Listed Stocks relative to control Listed Stocks. Further, Panel B shows that the change for Listed Stocks differs significantly from that of Nasdaq NM Stocks. However, none of the other variance ratios changed significantly.

Because the variance ratios relative to the daily level did not show any changes, the results on transitory volatility are somewhat weak. However, the result for Listed Stocks over the five minute horizon to thirty minute horizon still helps solidify the conclusion that the tick test dampens transitory volatility over the five-minute horizon but seems to have no effect on permanent volatility.

C. *Effect on Stock Prices*

As outlined in section III above, numerous theoretical models suggest that short selling constraints can affect equilibrium stock prices. Some of these models predict that stocks are likely to be more overpriced when short selling constraints are more binding, and when investors disagree more about the stock's true value.

Our evidence above suggests that price restrictions do constrain short selling somewhat. Thus, we are interested in testing the hypothesis suggested by these theories, that removing price restrictions will lessen overpricing. This hypothesis is not likely to hold unless the price restrictions are significant relative to other short selling constraints and our sample stocks are overpriced prior to the start of the pilot. Therefore, rejecting the hypothesis might mean that price restrictions are minor relative to other short selling constraints or that our sample stocks were not overpriced.

Table 8 reports average daily returns and average cumulative returns for pilot and control stocks in the period surrounding the beginning of the pilot. If pilot stocks are over-valued because of the price restrictions, these returns should be significantly negative for pilot stocks relative to the control stocks. Cumulative returns are normalized to zero on April 29, the trading day prior to the start of the pilot. As indicated in Panel A of Table 8, we observe for Listed

Stocks a statistically significant difference between the average returns of control and pilot stocks on May 2, the first day of the pilot. The average control stock experienced a return that exceeded the average pilot stock by about twenty-four basis points. However, we do not observe significant differences in returns on other days after the start of the pilot, nor are the cumulative returns statistically distinguishable at horizons beyond the first day. For Nasdaq NM Stocks, we observe no differences in daily or cumulative returns at or after the start of the pilot that are statistically significant at the five percent confidence level.[53] Because the Listed difference does not persist and because of a lack of a difference in Nasdaq NM Stocks, neither the tick nor the bid test appear to cause stocks to be over-valued.

Figure 1 displays the returns for the pilot and control samples over the first six months of the pilot. The figure gives the raw returns as well as the market adjusted returns. Returns in general appear to be positive over this period but are close to zero when subtracting the market return. Further, the pilot sample appears to under-perform the control sample, especially for Listed Stocks. Table 9 confirms that the six month returns of the pilot stocks appears lower than that of the control stocks. However, this result is not statistically significant. Therefore, the six month returns for the pilot sample are statistically similar to the six month returns for the control sample.

Table 9 also shows that the average alphas are negative but very close to zero. This means that when controlling for risk, the returns of the sample stock are about the same as the returns of the market portfolio. Further, the univariate results of Panel A and the regression results of Panel B show that the alphas of the pilot sample are statistically similar to the alphas of

[53] On the Nasdaq NM side, we do observe a statistically significant difference on a single day several days prior to the start of the pilot (April 26). In Table 8, we tested for statistical significance on 21 separate days in two different markets, for a total of 42 different hypothesis tests. Under the hypothesis that the pilot has no effect, we would expect random errors to cause roughly two out of the 42 tests to show false positive significance at the five percent level.

the control sample. Therefore, the pilot stocks did not underperform the control stocks. This suggests that the removal of the price restrictions will not result in either a long horizon correction of over-pricing nor is it likely to lead to prices being driven below their equilibrium value.

Table 9 also shows the tendency of the alphas to be significantly positive or significantly negative. An alpha is deemed to be negative if the estimate is significantly negative at the 5% level in a two-tailed test. Similarly, an alpha is considered to be positive if the estimate is significantly positive at the 5% level in a two-tailed test. If the alphas are completely random, we would expect to find 2.5% of them positive and 2.5% of them negative. Table 9 shows that the frequency of positive alphas is less than 2.5% while the frequency of negative alphas is slightly higher.[54] The frequency of negative alphas is statistically similar for pilot stocks and control stocks, providing further evidence against prices being driven below their equilibrium level. Among Listed Stocks, the control stocks appear to be more likely to have positive alphas, potentially because price restrictions facilitate over-pricing. This finding however, is weakened by the observation that fewer than 2.5% of control stocks have significantly positive alphas.

D. Market Manipulation

Because the type of analysis conducted in this study cannot directly prove whether market participants are engaging in manipulative practices, it is inherently difficult to measure whether the Pilot has had any impact on the degree to which markets are susceptible to manipulation. Our approach is to identify certain data patterns that we would expect to be more

[54] We also estimated the alphas using the value-weighted index. About 2.5% or fewer alphas were significantly positive and about 2.5% or fewer were significantly negative.

prevalent in a world where prices are manipulated, and investigate to see if these price patterns are more common for pilot stocks than control stocks. Such a pattern does not necessarily mean that manipulation has occurred, but indicates that we might have cause for further analysis.

As argued above in section I-B, if price restrictions inhibit manipulation by short sellers and/or facilitate upward manipulation, we might expect to see more large, sudden price declines and more price increases in pilot stocks than control stocks. If so, this should be reflected in the form of decreased skewness in the short-term returns distribution.

Table 10 reports results of statistical tests based on 5-minute, 30-minute, and 1-day returns. For each returns horizon, we follow the same approach as before and test for changes in skewness between the Pre-Pilot Period and Pilot Period, separately for pilot and control stocks, and for Listed and Nadaq stocks, and then test whether the difference of differences is significantly different from zero.

As the table indicates, we find no significant changes between the Pre-Pilot Period and Pilot Period, with the single exception that there appears to have been a marginally significant decline in the skewness of Listed pilot stocks at the 30-minute return interval. However, neither in this nor any other case do we find any statistically significant differences between pilot and control stocks. Thus, we find no evidence that the pilot program has had any impact on returns skewness. The results reported in Table 10 are based on the skewness of returns computed using trade prices.[55]

Our second approach to testing whether eliminating price restrictions may lead to an increase in price patterns indicative of market manipulation involving short sales is to examine the relative frequency of large negative and positive price reversals, as explained in section V-C,

[55] We also performed the test using returns computed using quote midpoints (results not reported) and again found no significant differences between pilot and control stocks. Using this alternative measure, the point estimates indicate an even smaller difference than indicated in Table 9.

above. Our results are presented in Table 11. Panel A reports results for return reversals occurring over subsequent 5-minute intervals, and Panel B reports results based on 30-minute intervals.

In this table, the line corresponding to "Reversal Size > 2" reports the number of times (per 100,000 observations) that a stock price move of 2 standard deviations or more was reversed in the subsequent period. So, for example, the number 338.4 in the first column of Panel A indicates that for Listed, pilot stocks, the frequency of negative five-minute reversals greater than two standard deviations in magnitude is approximately 0.003384, or 338.4 out of 100,000. In this table, statistical significance is ascertained using a nonparametric bootstrapping procedure outlined in section V-C. This test, which is applied only to the pilot sample, indicates whether the observed frequency of reversals would constitute a rare event under the null hypothesis that the distribution of reversals is the same for control and pilot stocks. Results are reported for thresholds ranging from two to nine standard deviations.

Our results in Panel A indicate that the pilot stocks tend to experience significantly more 5-minute return reversals than the control stocks, at least for thresholds in the range of two to four standard deviations. This same result is observed for Listed Stocks and Nasdaq NM Stocks. If price restrictions deter price patterns consistent with downward manipulations but not upward manipulations, we might expect to see more negative price reversals in the pilot sample than the control sample, but no difference in positive reversals. In our sample, however, the effect of the pilot appears to be equally as strong, if not stronger, for positive reversals than for negative reversals.

The results based on the 30-minute horizon, reported in Panel B, tell a different story. At the 30-minute horizon, there is no longer any statistical evidence that pilot stocks have a higher

frequency of reversals than control stocks.[56] If anything, the result is in the opposite direction—for Listed Stocks at the higher threshold levels, there appears to be some evidence that there are significantly fewer positive reversals for pilot stocks than control stocks.

As explained in Section V-D, above, our third approach to investigating whether removing price restrictions increases the prevalence of price patterns consistent with market manipulation is to use an autoregression model to estimate the extent to which positive and negative returns tend to be reversed in subsequent periods. The results of this analysis are presented in Table 12.

Panel A shows how five minute returns are correlated with the returns of each of five previous five-minute periods. A positive number reflects returns in the same direction. A negative number reflects return reversals. Most of the coefficients in Table 12 are negative, reflecting a tendency for five-minute price changes to be reversed over subsequent periods. While many of the autocorrelations changed from the Pre-Pilot to Pilot Period, we focus on how the pilot sample compares to the control sample. Over one lag, removing price restrictions makes returns in Listed Stocks more negatively autocorrelated. This is true whether the previous returns were positive or negative. The effect continues for two lags (ten minutes), but only following positive returns. Price restrictions have no effect on five-minute return autocorrelation in Nasdaq NM Stocks.

[56] Panel B of Table 11 reports results for 32 different hypothesis tests (eight different thresholds, positive and negative reversals, Listed and Nadaq samples). Of these 32 tests, only one indicates statistical significance at the five percent level (negative reversals for Listed Stocks at the 3-standard deviation threshold). Even under the null hypothesis of no true effect, we would expect any individual test to show a "false positive" at the 5% significance level approximately 5% of the time. Thus, one significant test statistic out of 32 tests does not constitute a meaningful rejection of the null hypothesis.

Panel B shows the results for thirty minute returns. Measured relative to control stocks, the pilot stocks experience no statistically significant increase in return correlation for any of the thirty minute intervals examined.

In summary, returns in Listed Stocks are negatively serially correlated following both positive and negative returns over short horizons and removing price restrictions increases this negative correlation. The symmetry of these results is consistent with the volatility results above. We find no statistically significant impact for Nasdaq NM Stocks.

E. Small and Low-Volume Stocks

The analysis presented heretofore analyzes Listed Stocks and Nasdaq NM Stocks separately, but beyond this does not make any effort to ascertain whether the pilot may have a disproportionate or qualitatively different effect on smaller or less liquid stocks. In order to address these questions, we partition the sample into deciles according to market capitalization and turnover. As described above in section V-E, we partition the sample into deciles before separating them across markets, to ensure that Listed Stocks and Nasdaq NM Stocks in the same decile are comparable. The sample sizes resulting from these decile partitions are reported in Table 13. As the table indicates, the Listed Stocks are more concentrated in the higher deciles of market capitalization, while the opposite is true for Nasdaq NM Stocks. However, both Listed and Nasdaq NM Stocks have representation across all deciles of the two measures.

Tables 14 through 26 present our results analyzing how many of the results presented earlier vary as a function of size and liquidity. As explained in section V-E, above, these tables are based on a regression analysis where each model includes a pilot indicator and a pilot indicator interacted with indicator variables for deciles one through nine. In this model, the

marginal effect of the pilot is captured through two channels, first through the pilot indicator variable, and secondly through the interacted indicator variable. To facilitate interpretation, the tables report the sum of the coefficients on the pilot dummy and the interacted terms. This way, the entries in the table show directly how the pilot sample differs from the control sample within each decile.

Table 14 shows how the tick and bid tests affect short selling volume for stocks in each size and turnover decile. Removing the rules increases short selling volume in almost every size and volume decile. Further, the tick test appears to hinder short selling slightly more in small stocks than in large stocks. The bid test, on the other hand, appears to hinder short selling slightly more in large stocks than in small stocks. The affect of the tick and bid tests appear unrelated to turnover level. According to the Nasdaq market share results in Table 15, the removal of the bid test on Nasdaq seems to increase Nasdaq's market share more for small stocks than for large stocks. Overall, the tick and bid tests do seem to have differing affects on short selling for stocks of varying sizes.

In results not reported in tables, only the tick test has a differential effect on the balance of trading in stocks of differing sizes while all other mechanical effects are similar across size and activity levels. The tick test has a bigger effect on the symmetry of trading in smaller stocks but a constant effect on the symmetry of stocks of varying activity levels.

Tables 16 and 17 show whether the augmentation of the bid and ask depth is similar for large and small stocks. These patterns are qualitatively similar in both tables. The tick test augments depth across almost all size and activity levels without clearly augmenting large or small stocks more. The bid test's influence on depth, however, varies widely across size and

activity levels without a discernable pattern. Therefore, the depth augmentation from the tick and bid tests appears unrelated to the size or activity level of the stocks.

As stated above, the increase in the depth at the inside quote affects the displayed supply of liquidity but might not influence realized liquidity, as measured by effective spreads. Table 18 shows that the tick test has no effect on effective spreads for almost all size and activity levels. The bid test, however, seems to result in lower effective spreads for large or more active stocks and potentially higher spreads for small or less active stocks. When significant, however, the magnitudes are still only a few basis points.

The results above show that transitory volatility is dampened by the tick test with much weaker evidence on the bid test. Table 19 shows that the tick test primarily dampens the volatility of small stocks but seems to amplify the volatility of large stocks. The bid test shows a similar pattern but to a lesser degree. The results across turnover levels are not as striking. The tick test seems to dampen volatility for most activity levels and the bid test shows similar yet substantially weaker evidence.

Table 20 summarizes the evidence on how the tick and bid tests affect longer-term variance. While the tick test does not affect the daily return variance in stocks as a whole, it does seem to dampen daily return variance in small stocks and increase daily return variance in large stocks. The bid test shows a similar pattern but the effect is only significant for a few of the smaller size levels. The tick and bid tests have no effect on daily return variance for any activity level.

The results above show little evidence that the tick or bid tests affect price levels. However, there is a 24 basis point return difference between pilot and control Listed Stocks on the first day of the Pilot. Table 21 summarizes whether this return difference varies by size or

activity level. The evidence shows that for most size and activity levels, the pilot and control stocks experienced a statistically similar return on the first day of the Pilot. The Listed pilot stocks had a lower return than the control stocks in the largest size group while the Nasdaq NM pilot stocks had a lower return than the control stocks in the highest turnover group. Hence, the prior results seem to be driven by the large Listed Stocks.

Table 22 compares the pilot stock six-month alphas to the control stock six-month alphas for the various size and activity groups. Like the May 2 results, the pilot alphas are statistically similar to the control alphas in every size and activity level. Therefore, the tick and bid tests do not promote or hinder pricing efficiency for any size or activity level.

Recall from Table 11 that negative and positive five-minute price reversals are more prevalent in the pilot sample than the control sample, especially for Listed Stocks. Repeating our analysis across deciles, we find the difference between pilot and control Listed Stocks is significantly more pronounced for stocks with the lowest market capitalization (results not presented). These findings are consistent with our other results indicating that smaller stocks tend to be more volatile when the tick test is removed. However, for the smallest Listed Stocks, we observe a greater number of positive than negative price spikes, suggesting that removing the tick test does not make smaller stocks unduly susceptible to negative price pressure.

VII Summary and Conclusions

The pilot program established by Regulation SHO exempted approximately one third of the Russell 3000 stocks from the "tick test" (Rule 10a-1) for Listed Stocks and the "bid test" (former NASD Rule 3350) for Nasdaq NM Stocks traded on Nasdaq or traded OTC and reported to an NASD facility. The pilot was designed to facilitate comparison between the pilot stocks

and control stocks, thus creating an unprecedented opportunity to observe in a controlled environment the effects of removing the price restrictions.

This study has compared pilot and control stocks along numerous dimensions, in an effort to capture a broad range of possible effects. Our main empirical results are as follows:

- The pilot is associated with increased short selling volume in Listed and Nasdaq NM Stocks, but appears to have no impact on the level of short interest in either market. The increase in short selling is slightly higher for small Listed Stocks than for large Listed Stocks.

- The pilot is associated with an increase in Nasdaq's share of trading volume in Nasdaq NM Stocks, suggesting that market participants are routing trades to other venues in order to avoid the bid test. The market share increases more for smaller stocks. For the largest Nasdaq NM Stocks, such as those included in the Nasdaq 100, there is no significant difference in market share.

- We find no evidence that the pilot has had any impact on the level of trading activity in the options market, as we would have expected to see if market participants are using option markets to avoid the tick test or the bid test.

- For Listed Stocks, less than 46% of all trades are executed on down bids when the tick test applies, while the number is close to 50% for pilot stocks, suggesting that Rule 10a-1 constrains the execution price in four to five percent of trades. For Nasdaq NM Stocks, Rule 3350 does not explicitly prevent trading on downticks, but our results show that it effectively constrains trading on downticks for about one half of one percent of trades.

- The pilot is associated with a decrease in quote depth, especially on the ask side for Listed Stocks—our evidence confirms that Rule 10a-1 forces some short sellers who would otherwise be liquidity demanders to act as liquidity suppliers. The decrease in depth appears unassociated with size or turnover.

- Other than the effect on market depth, the pilot has had no clear effect on market liquidity—most of our tests indicate that liquidity was not significantly impacted by the pilot, but some tests indicate small increases or decreases in liquidity, depending on the measure.

- The pilot is associated with an increase in some measures of intraday volatility. These increases appear to be confined to the smaller stocks as larger stocks experienced a decline in volatility during the pilot.

- On average across all types of stocks, the pilot does not appear to have any significant effect on daily volatility—however, our results indicate the pilot is associated with

lower volatility for stocks with higher market capitalization, and higher volatility for stocks with lower market capitalization.

- Based on the price reaction to the initiation of the pilot, we find limited evidence that the tick test distorts stock prices—on the day the pilot went into effect, Listed Stocks in the pilot sample underperformed Listed Stocks in the control sample by approximately 24 basis points. However, the pilot and control stocks had similar returns over the first six months of the pilot.

- We find no evidence of "bear raids" associated with the pilot. More specifically, we test for evidence of bear raids in three ways:

    - We test whether the pilot has affected the relative frequency of large negative vs. large positive stock returns, as reflected in the skewness of the returns distribution. There is no difference in skewness between control and pilot stocks
    - A bear raid may be associated with a large negative return that is very quickly reversed, or a "negative price spike." Although we do find a higher incidence of negative price spikes in the pilot sample at some horizons, the same thing is observed for positive price spikes.
    - We also measure directly the tendency for price movements to be reversed in subsequent periods. Again, we find that the pilot is associated with a slightly greater tendency for price changes to be reversed, but this effect is observed equally for positive and negative returns.

In summary, having examined the impact of the Regulation SHO Pilot on a wide array of market characteristics, we conclude that price restrictions constitute an economically relevant constraint on short selling. Our evidence suggests that removing price restrictions for the pilot stocks has had an effect on the mechanics of short selling, order routing decisions, displayed depth, and intraday volatility, but on balance has not had a deleterious impact on market quality or liquidity. In various dimensions, our evidence confirms that the tick test of Rule 10a-1 acts as a more binding constraint than the bid test of former NASD Rule 3350. On most dimensions, the effects of the pilot do not appear to be systematically related to market capitalization or trading volume, suggesting that our results give a reasonable picture of what we might expect to see if price restrictions were removed for all stocks, including smaller stocks and stocks less actively

traded than those in the Russell 3000. However, some results, particularly those involving volatility, suggest that the effect of the tick test and the bid test may be systematically related to market capitalization.

We conclude with a few caveats. While the Pilot study was designed to facilitate a natural experiment in a controlled environment, the results might not be entirely representative of removing the rule permanently for all stocks. It is possible that traders might behave differently if a rule were permanently and completely removed than if it is only temporarily or incompletely removed. Moreover, it is possible that traders with manipulative intentions might be on good behavior if they believe that heightened scrutiny during the Pilot increases their chances of getting caught.

Tables

Table 1: Sample characteristics

This table shows the number of sample stocks categorized by whether they are in the Pilot, their listing status, and whether they have tradable options on them. The Pilot stocks are those designated in the first Pilot Order that are trading on Amex, Nasdaq NM, or NYSE as of May 2, 2005. The Control stocks are the ones that were eligible to be selected for the Pilot but were not. The Control stocks are limited to those trading on Amex, Nasdaq NM, and NYSE as of May 2, 2005. Listed Stocks are stocks listed on NYSE or Amex. This table shows the sample sizes as of October 31, 2005 as well. To avoid survivor biases, we retain stocks in the sample even if they stocks cease trading on Amex, Nasdaq NM, or NYSE before the end of our sample period on October 31, 2005. This table shows the sample sizes as of October 31, 2005 as well. Stocks are considered optionable if they have traded options at some point in the four months prior to the start of the Pilot. Short-term options are options with experations within one year.,

Variable	Listed Stocks		Nasdaq Stocks	
	Pilot	Control	Pilot	Control
# Stocks (first day of the Pilot)	504	973	439	917
# Stocks (last day of the Sample Period)	496	949	423	877
# Optionable Stocks (all options)	350	690	278	573
	(69.44%)	(70.77%)	(63.33%)	(62.28%)
# Optionable Stocks (short-term options)	350	688	277	567
	(69.44%)	(70.56%)	(63.10%)	(61.63%)

Table 2: Comparison of Pilot and Control Stocks Before Initiation of Pilot

This table compares the Pilot and Control stocks in several statistics over the four month period prior to the start of the Pilot on May 2, 2005. The statistical difference between the samples is tested using a two-sample t-test. * and ** indicates that the Pilot stocks are statistically different from the Control stocks at the 5% and 1% levels in a two-tailed test.

Variable	Listed Stocks		Nasdaq Stocks

Table 3: Changes in Short Selling Activity

This table summarizes how short selling changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" and the six months following the start date are called the "Pilot". The table shows the average change in short selling for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Short Volume is the number of shares in short sale transactions divided by total share volume. Short Trades is the number of short sale transactions divided by total transactions. Short Interest is the monthly short interest times 100 divided by the shares outstanding. Days to Cover is the monthly short interest divided by the average daily share volume during the corresponding month. Nasdaq market share is Nasdaq's share of the volume of short selling. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the Difference in the Change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 4: Changes in Option Trading

This table summarizes how option trading and open interest changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" and the six months following the start date are called the "Pilot". The table shows the average change in option trading and open interest for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Panel A reports statistics on all options. Panel B reports statistics on short-term options. The data includes securities that had put and call option volume in both the Pre-Pilot and Pilot periods. There were a total of 690 Control stocks and 350 Pilot stocks included in the Listed sample and 573 Control stocks and 278 Pilot stocks in the Nasdaq sample. Open interest and volume are adjusted for stock splits. New option listings after May 1, 2005 were excluded from the analysis. The data source for the options data is the Options Price Reporting Authority (OPRA). Short-term options are identified using the Options Clearing Corporation directory. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We also test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using two sample t-tests. [a, b] indicates that the difference for Nasdaq NM Stocks is statistically different from the difference for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 5: Changes in Trading and Quoting Mechanics

This table summarizes how trading and quoting mechanics change when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" Period. The table shows the average change in the number of down ticks and the percent of time on a down bid for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 7: Volatility

This table summarizes how volatility changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The table shows the average change in various volatility measures for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Daily Price Range is 100*(log high – log low). Absolute return and standard deviation are reported in percentage points. While standard deviation is reported, tests were run on variances to avoid Jensen's inequality. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for pilot securities and the variable's Pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 8: Returns around the May 2, 2005 Start of the Pilot

This table shows the returns surrounding the May 2 initiation of the pilot. The raw returns are equally-weighted averages of the returns for each stocks, as collected from CRSP. The Cumulative Returns are set to be zero on the day prior to the start of the pilot. The Cumulative returns represent the compounded returns on an investment made at the April 29 closing price. * indicates that the control stock returns are statistically different from the pilot stock returns at the 5% significance level in a two-tailed test. None of the returns are statistically different at the 1% level.

Table 9: Six Month Returns

The table summarizes tests of whether the six month returns of the pilot stocks differ from the six month returns of the control stocks. The raw returns are compounded cumulative returns from CRSP. If a stock is not in the sample for the entire six months, its return from its last day is compounded to six months. The market adjusted returns is simply the raw return minus the CRSP equally-weighted index. The alpha is estimated in-sample by regressing the raw return for a stock on the equally-weighted CRSP index return. A stock's alpha is considered "negative" if it is statistically below zero at the 5% level in a two-tailed test. Likewise, a stock's alpha is considered "positive" if it is statistically above zero at the 5% level in a two-tailed test. ** indicates that the control stock returns are statistically different from the pilot stock returns at the 5% significance level in a two-tailed test.

Panel A: Univariate Differences

Variable	Market	Pilot	Control	Difference
Raw Return	Listed	9.18%	11.56%	-2.38%
Raw Return	Nasdaq	14.21%	16.30%	-2.09%
Market Adjusted Return	Listed	-2.10%	-0.00%	-2.07%
Market Adjusted Return	Nasdaq	2.26%	4.01%	-1.74%
Alpha	Listed	-0.05%	-0.04%	-0.01%
Alpha	Nasdaq	-0.04%	-0.02%	-0.01%
Negative Alpha	Listed	5.56%	4.93%	0.60%
Negative Alpha	Nasdaq	2.73%	1.53%	1.20%
Positive Alpha	Listed	0.00%	0.92%	-0.92%**
Positive Alpha	Nasdaq	0.91%	1.20%	-0.29%

Panel B: Regression Tests

Market Model Alpha = $\alpha + \beta$ Pilot

Variable	Market	Pilot	R-squared
Alpha	Listed	-0.0001	0.009
Alpha	Nasdaq	-0.0001	0.005

Table 10: Skewness

This table summarizes how skewness changes when the tick and bid tests are removed. The four months prior to the pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The table shows the average levels and changes in various skewness measures for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Sample skewness is computed for each stock in the pilot and contol sample in the Pre-Pilot and Pilot period, for five-minute, thirty-minute, and one day return intervals. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1% and 5% level in a two-tailed test.

		Pilot Sample			Control Sample			Pilot Δ minus
Variable	Market	Pre-Pilot	Pilot	Δ	Pre-Pilot	Pilot	Δ	Control Δ
Skewness—5m	Listed	0.08	-0.05	-0.13	0.24	0.01	-0.23	0.10
Skewness—5m	Nasdaq	0.28	0.51	0.23	0.19	0.39	0.20	0.03

Table 11: Extreme Price Reversals

This table summarizes how the frequency of large negative and positive short-horizon price reversals differs across pilot and control stocks. The numbers in the table represent the number of reversals per 100,000 stock/intervals. A negative (positive) reversal is defined as a negative (positive) return immediately followed by a positive (negative) return. The "size" of the reversal is defined as the minimum absolute value of the two adjacent returns, normalized by the pre-pilot standard deviation of the stock's holding-period return, where the second return is computed as a percentage of the lagged price, and the holding period is five minutes or thirty minutes. The frequency of reversals is computed based on a six-month period following the pilot start date (May 2, 2005). The pre-pilot standard deviation used to normalize the returns is computed over a four-month period prior to the start date. Nonparametric statistical tests based on a bootstrapping procedure determine whether the number of reversals observed in the pilot sample would be statistically rare in the control sample. **, * indicates statistical significance at the 1% and 5% level in a two-tailed test.

Panel A: Five-Minute Return Reversals

	Listed Stocks				Nasdaq Stocks			
	Negative Reversals		Positive Reversals		Negative Reversals		Positive Reversals

Table 12: Semi-Autoregression Results

This table reports average regression coefficients of returns on lagged positive and negative component returns, for pilot and control stocks before and after the start of the pilot. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The coefficients reported in the table are the mean coefficients across all stocks in the subsample, estimated over the designated period, of the autoregressive model:

$$R_t = \sum_{n=1}^{5} \alpha_n R_{t-n}^{-} + \sum_{n=1}^{5} \beta_n R_{t-n}^{+} .$$

where R_t represents the stock return in period t, and

$$R_t^{-} = \min(0, R_t) \qquad R_t^{+} = \max(0, R_t) .$$

Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test.

Table 13: Sample Deciles

This table shows the number of stocks in each market capitalization, turnover, and short selling decile. The deciles are set so that each decile contains the same number of stocks for the full sample. This table reports the subsample sizes separately for pilot and control stocks and for Listed and Nasdaq NM Stocks. It also gives the proportion of stocks in that decile and market that are pilot or control stocks.

	Listed				Nasdaq			
	Pilot		Control		Pilot		Control	
	Count	Proportion	Count	Proportion	Count	Proportion	Count	Proportion
Decile	Market Capitalization							
Lowest	22	33.9	43	66.1	62	28.4	156	71.6

Table 14: Changes in Short Selling Activity Across Market Cap and Turnover Deciles

This table shows the marginal effect of the pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Short Selling Volume}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Short Selling Volume}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the number of shares sold short on a day divided by the total volume on that day. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

	Market Capitalization		Turnover	
	Listed	Nasdaq	Listed	Nasdaq
Decile				
Lowest	-0.26	-1.55**	2.84**	1.44**
2	4.83**	1.68**	2.84**	1.17**

Average R^2	0.10	0.09	0.10	0.09

Table 15: Changes in Nasdaq Market Share Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Nasdaq Market Share}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Nasdaq Market Share}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the Nasdaq share of short selling volume on a day. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. ** indicates that the effect is statistically different from zero at the 1 % level in a two-tailed test.

	Market Capitalization		Turnover

Table 18: Changes in Effective Spread Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Relative Effective Spread}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Relative Effective Spread}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the relative effective spread. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

Appendix A: Concurrent Regulation SHO Pilot Studies

We have identified three concurrent studies that also examine the effect of removing the tick test and/or the bid test during the Regulation SHO Pilot. See the attached chart for a simplified comparison of the studies. Much of the analysis is similar to the analysis reported in this report, but the construction of the samples differs in important ways. Each approach has its merits. The main difference between the construction of the samples for this report and the sample construction in the concurrent papers is the incorporation of stocks that might be outliers. This report includes these stocks because they might be the ones most affected by the Pilot. The other studies exclude these stocks in order to improve matching between the pilot and control stocks or to remove the influence of confounding events. Despite the different decisions, many of the results of this report are supported by the results of the concurrent studies.

Findings				
Short Selling	Higher relative short sale volume. NYSE: higher number of short sale trades No impact on the number of NASDAQ short sale trades.	No significant impact on short sale volume for either NYSE or NASDAQ. NYSE: Pilot stocks had a higher number of short sales trades and a lower average short sale trade size. NASDAQ: No impact on number of short sales trades or average short sale trade size.	Examines only short selling on the NYSE Relative short selling increases for pilot stocks. Significant for small stocks but not large stocks.	Higher short sale volume and a higher number of short sale trades. No impact on short interest or days to cover. No impact on option trading volume or open interest. Trading is more balanced for pilot stocks. The increase in short selling is bigger for small stocks.

SEC_OEA_FCIC_001263

Study	Diether, Lee, and Werner (2006)	Alexander and Peterson (2006)	Wu (2006)	SEC
Liquidity	No impact on NASDAQ stocks. NYSE: Larger quoted, effective, and realized spreads, smaller quoted ask depth, higher relative bid depth, smaller buy imbalances.	NYSE: larger spreads, smaller quoted ask depth, smaller quoted bid depth, higher price impact NASDAQ: larger spreads No effect on effective spreads	Relative effective and quoted spreads increase with pilot by < 1 bps. This is statistically significant only for small stocks. Smaller buy imbalances across all market cap groups. Offer depth declines for most size groups.	Listed: smaller quoted ask depth in univariate and regression. Regression shows decrease in both bid and ask. Some tests show small increases or decreases in realized liquidity.
Volatility	No increase in the majority of the 26 different volatility measures for Pilot Stocks. NYSE: higher short term volatility (15/5 variance ratio), daily return volatility, trade to trade return volatility, offer to offer quote volatility, five-minute bid and offer volatility, daily up-side and down-side semi-variance. The authors examine semi-variance, trade returns, bid quote returns, and ask quote returns for various time lengths: trade to trade, quote to quote, five-minute, fifteen-minute, and daily. They also examine the 15/5 minute variance ratio.	No impact. The authors examine six volatility measures: 5 minute return volatility, semi-variance, daily relative price range, Fama-Franch three-factor model idiosyncratic risk, CAPM idiosyncratic risk, and implied volatility.	Variance ratios did not change with pilot. Daily price range and intraday price standard deviation do not change.	Some evidence of an increase in intraday volatility. This appears to be driven by smaller stocks as larger stocks saw a decline in intraday volatility during the pilot. While average daily volatility does not change, smaller stocks experienced lower volatility during the pilot as larger stocks experienced an increase.

SEC_OEA_FCIC_001264

Study	Diether, Lee, and Werner (2006)	Alexander and Peterson (2006)	Wu (2006)	SEC
Efficiency		No impact except for the following measures for NYSE stocks: higher autocorrelation of five-minute returns, greater likelihood of a lower price for the second trade after a short sale, and greater likelihood of a higher trade price for the first trade after a short sale. The authors examine the autocorrelation of five- and thirty-minute returns, upside minus downside r-squared, and price runs.	Hasbrouck pricing errors show no significant change with pilot. Intraday return autocorrelations (30 and 60 minute) did not change with pilot.	Higher five-minute return reversals. Higher five-minute semi-autoregression. No impact on thirty-minute return reversals, thirty-minute semi-autocorrelation, or on skewness in five-minute, thirty-minute, and daily returns.
Returns		No significant impact on returns surrounding the announcement date of the Pilot stocks, on the initiation day of the Pilot, or during the first month of the Pilot.		Listed pilot stocks had a 24 bps lower return than control stocks on the initiation day of the Pilot but had statistically similar cumulative return during the 6 months after the Pilot.
Conclusion	While the suspension of the NYSE tick test is found to be associated with larger spreads and higher short-term volatility, this evidence is consistent with the distorting effects of the tick test on short sellers (i.e., forcing them to be liquidity suppliers) rather than any benefit to investor welfare.	Concerns about the removal of the price tests leading to a degradation of market quality are unfounded. Price tests do not further the stated objectives of short sale regulation.	Tick test reduces short selling and narrows the spread primarily for small stocks. Tick test does not seriously constrain short sellers from trading on their information.	Most evidence shows that the pilot had a minor effect. The most intriguing results are in volatility. Some evidence that the tick test has a bigger effect in small stocks.

SEC_OEA_FCIC_001265

OFFICE OF ECONOMIC ANALYSIS
MEMORANDUM

To: Chairman Christopher Cox

Through: James Overdahl

From: Daniel Aromi and Cecilia Caglio

Date: December 16, 2008

Re: Analysis of Short Selling Activity during the First Weeks of September 2008

This memo is written in response to questions posed by you and the other commissioners concerning the nature of short selling in the volatile period in early September 2008 that prompted the Commission to approve several emergency orders, many of which were aimed at curbing the potential for short selling to drive prices down. The main objective is to examine the extent to which short selling appeared to drive prices downward during this period.[1] To this end, this memo seeks to establish if, at an intraday level, there exists an association between measures of short selling activity and stock returns. In particular, we would like to document whether periods of negative returns are associated with unusually high short selling activity.

There are different reasons why investors and intermediaries short sell stocks. These include liquidity provision and speculative trading. Further, as is the case with other buys and sells, short-selling can also be used to "front run" other investors or manipulate prices. Depending on their motives, some short sellers might be contrarian traders, short-selling during periods of positive returns, while others might be momentum traders. In addition they might differ in terms of the price aggressiveness of the orders submitted with its resulting price pressure. The impact of measures that restrict short sales depends on how different short sellers are affected by the restrictions. For example, restricting short sales that provide liquidity or react to price overreaction might result in higher transaction costs and higher volatility.

Our results are inconsistent with the notion that, on a regular basis, episodes of extreme negative returns are the result of short selling activity. On average, short sale volume as a fraction of total volume is higher for periods of positive returns than for periods of negative returns. In addition, the average price aggressiveness of sellers who own the stock is higher than what is observed for short sellers. Our analysis is based on average behavior, we can not rule out the possibility that there might exist some instances in which short selling activity peaked during a period of extreme negative returns.

Short sale volume as a fraction of total volume is higher for periods of positive returns than for periods of negative returns. We find the same results when we compare extremely low and extremely high return periods. In addition, the average volume of short sales is generally not significantly higher for periods of negative returns when compared to periods of positive returns.

[1] Note that this analysis does not test for a causal relationship between short selling and stock prices or returns, but it can provide statistics that are consistent or inconsistent with such a causal relationship.

SEC_OEA_FCIC_001266

The analysis of the price pressure emphasizes the role of short sellers during extreme market movements. In general, during periods of extreme negative returns, the sell pressure is more intense for long trades indicating that short sales put less pressure on prices than other sales during periods of extreme negative returns. During periods of extreme positive returns, we observe buy pressure, both for trades involving short sales and long trades. However, the selling pressure for other sales is higher than short selling pressure.

Data Selection and Methodology

Our study covers the 13-day period preceding the short selling ban imposed on September 19th 2008 because this is a period during which many observers were concerned that short sellers were driving prices down.

Even though our analysis period does not extend to the period when the short selling ban applied, we study both stocks that were ultimately subject to the short selling ban and stocks that were never subject to the ban. Presumably, the stocks subject to the ban were the ones that were more likely to be targeted by short sellers. Therefore, comparing these stocks to a set of other stocks allows for an analysis of whether short sellers did indeed behave differently in these stocks.

To more efficiently handle the computing demands of this analysis, we selected a subsample of stocks subject to the ban ("banned stocks") and a comparable subsample of stocks that were not subject to the ban ("control stocks"). We selected the firms from the original group of banned stocks based on the following selection criteria. We separate the 799 ban stocks into four groups by size[2]: top 50, and divide the remaining into thirds. We select randomly firms from each of the bottom three groups, and select all from the top group, to get a total of 196 firms.

Using the same size cutoffs that were used to select the banned stocks group, we randomly select the control sample from the entire population of stocks that were not subject to the ban. The final sample includes 394 firms, 196 in the banned sample and 198 in the control sample. We retain the information on the size groupings so that we can divide our two samples into subsamples by size.

We used intraday quote and trade data from TAQ to estimate stock volume, and intraday returns, data from the Center for Research in Securities Prices (CRSP) to estimate market capitalization, and SRO data to estimate short selling levels.

Description of short selling activity and return levels

The first part of our analysis examines the relation between short selling and returns. To capture short term price movements, we focus on five minute intervals. For each stock included in out

[2] We use the market capitalization as of December 2007 to create size groups; out of 799 only 781 firms had available data.

SEC_OEA_FCIC_001267

analysis, we compute the return, short selling volume, and total volume over each five minute interval during regular trading hours. We then estimate a short sale ratio for this interval, which is the ratio between short sale volume and total volume. Because every trade has a sell side, this ratio can be used to compare the prevalence of short sales relative to other sales.

The figure 1 shows the average short sale ratio for different five-minute return levels. Results are presented for the ban/control samples and four different levels of market capitalization.

The results show that, for high market capitalization and low market capitalization stocks, the short sale ratio is lower during periods with negative returns. In other words, there is less price reaction when a sale is a short sale instead of a long sale. Holding the absolute level of returns constant, the short sale ratio is lower for periods with negative returns. This is particularly noticeable for periods in which returns are extremely low or high. For example, Figure 1 shows that for large market capitalization ban stocks the average short sale ratio for five-minute returns lower than -225 basis points is approximately 0.28. This is approximately 17% (0.05) below the short sale ratio for the periods in which the return was above 225 basis points. Out of the eight groups of stocks, the group of banned low market capitalization stocks is the only one in which average short sale ratios are higher for negative return periods.

In addition to the high/low return level comparison, we observe that there is non monotonic relationship between volatility and the short sale ratio. Periods of low volatility, with return levels between -25 and 25 basis points, are characterized by low short sale ratios. For high and medium market capitalization stocks, short sale ratios increase from low volatility periods to intermediate volatility levels, that is, periods of moderately positive or negative return. Then, as we move from intermediate to extreme return levels, short sale ratios decrease.

To find out whether a similar pattern holds for lower frequencies, we also computed returns and average short sale ratios for 30 minute periods. The computed statistics are shown on figure 2. Our previous conclusions are strengthened by the 30 minute statistics. For every subgroup of stocks we find that the short sale ratio is, on average, lower for negative return periods.

This is an analysis of average levels of short selling activity. It shows that intraday short-selling activity is not consistent with the idea that, on average, extreme negative returns are the result of short-selling activity. We do not rule out the possibility that there might be some instances in which short-selling activity did increase during a period of extreme negative returns. But it is clear that a substantial fraction of short sale volume is not associated with negative returns; and this suggests that short selling is not merely a tool for driving prices down.

Analysis of short selling activity during extreme return periods

A. Short-selling volume

In this section we compare measures of short-selling activity for periods of extremely low and extremely high returns. The focus on extreme return periods is justified since the concern about short sales is centered on volatility. For each stock we calculate the standard deviation of five minute returns for the analysis period. A five minute period is classified as a period of extreme negative returns if the return for that period is lower than -2 times the standard deviation

calculated for that stock. A five minute period is classified as a period of extreme positive returns if the return for that period is higher than 2 times the standard deviation calculated for that stock.

For this analysis, we focus only on the periods of extreme returns and estimate the average short sale ratio, short sale volume and total volume across extreme positive return periods and extreme negative return periods for each size group in our sample. The number of periods with extremely high and extremely low returns is similar and accounts for approximately 1% to 2.5% of the total number of periods.

The statistics are shown in Table 1. We find that the short sale ratio is mostly higher during periods of positive returns than during periods of negative returns. In other words, higher intensity of short selling is associated with higher returns. For "control" stocks, the average short sale ratio is significantly higher in extremely positive return periods than in extremely negative return periods for all size groups. For stocks in the ban the average short sale ratio in positive return periods is higher than in negative return periods for the top three size groups. But it is significantly higher only for the group with the largest market capitalization.

These tests confirm our previous observation that short-selling activity is higher in periods with positive returns, but these results focus specifically on extreme returns. We find that for all but one subgroup, short selling is higher during periods of extremely positive returns than in periods of extreme negative returns. In addition, the difference is significant for many of the size groups, especially for control stocks.

These findings indicate that, on average, short seller's intraday activity is contrarian. On average, short sales seem to decrease intraday volatility by selling relatively more during periods of positive returns.

The difference between the stocks subject to the ban and control stocks is noteworthy, especially as we consider smaller stocks. In particular, the association between relatively higher short selling ratios for positive return periods versus negative return periods is weaker for stocks in the ban than for control stocks. This difference deserves further investigation. For example, this might be an indication of a different mix of short sale motives for the two groups of stocks. A partition of short sale activity by motive is beyond the scope of this memo and might be unattainable without information on investor level holdings information.

Additionally, we checked the robustness of our results by running the tests in various ways, but none of these changes affect the results. These preliminary analyses are not reported on the table. For example, we considered different criteria for classifying extreme return. Instead of using a threshold of 2 times the standard deviation we also considered 1 time the standard deviation and 3 times the standard deviation. In addition, we studied short-selling activity and returns for 30 minute periods instead of 5 minute periods.

We also studied short-selling activity before and after periods of extreme returns. We found that short-selling activity is significantly higher after extremely positive returns than after extremely negative returns. This is consistent with the idea that an important fraction of short sellers are contrarian traders and benefit from short term price overreaction. We do not find any significant differences in short-selling ratios for periods that precede extremely negative and extremely

positive returns. This is not consistent with the idea that short sales cause extreme negative returns.

B. Price Pressure

In this section, we compare the price aggressiveness of trades involving short sales to trades that do not involve short sales, dividing the stocks into four groups by size, extreme return, and inclusion in the short selling ban.

In order to identify and separate long trades from short sales trades, we merge the short-selling transaction data with the dataset of all transactions and then assign the prevailing BBO to each trade.[3]

To measure the degree that short sales put pressure on prices, we compute a measure of price pressure, or price aggressiveness, for each five-minute period. We define this measure for short sales as the difference between short sale volume executed above the quote mid-point and short sale volume executed below the quote mid-point divided by total short sale volume. A number below zero would indicate that short sellers tend to demand liquidity while a number above zero would indicate that short sellers tend to supply liquidity. The lower the measure of price aggressiveness, the more the traders tend to be liquidity demanders, who can apply more price pressure than liquidity suppliers. We estimate a similar measure for trade volume that does not involve a short sale. We report these measures in Table 2.

We observe that during intervals of extreme negative returns, the price pressure is negative indicating that executed sell orders in general demand liquidity during periods of extreme negative returns. Interestingly, the measure of price pressure is less negative for short sales than for other sales, suggesting that short sales put less pressure on prices than other sales during periods of extreme negative returns. The results are statistically significant for large and mid capitalization stocks. We observe buy pressure, both for short sales and other sales, during periods of extreme positive returns. For large stocks, the buy pressure is statistically higher for short sales than for other sales (0.23 versus 0.08 and 0.21 versus 0.10 for banned and control stocks, respectively). This result indicates that all sellers are liquidity suppliers during periods of increasing prices and that short sellers are more likely to be supplying liquidity than long sellers.

When we compare the price pressure for banned and control stocks, short sales are more likely to be liquidity suppliers in banned stocks than in control stocks. This is particularly true in the case of negative market movements: short sale price pressure is negative, but is less negative for banned stocks compared to control stocks (for brevity, the statistical significance tests are not reported on the table). This evidence is not consistent with stories that short sellers exerted more price pressure in financial stocks than in other stocks during this time period.

[3] We match TAQ trade data with the short sale dataset provided by the market centers by four conditions: same symbol; same market center; same trading price; same timestamp. We exclude trades and quotes that have a code indicating an error or a correction, or a nonstandard settlement. We were able to match about 92% of the short selling trades.

We also analyzed short-selling price pressure after periods of extreme returns. These analyses are reported on Table 3. We found that after extreme negative return intervals, the short sale price pressure is positive and statistically different from the price pressure for other sales. This result supports the idea that short sellers are not demanding liquidity after prices decline. We also notice that the short-selling price pressure is positive after periods of extreme positive returns, while for other sales the negative price pressure indicates a sell pressure. The results support the intuition from the previous section that, in aggregate, short sellers act as contrarians.

Figure 1:

Short selling ratio and return levels – Five minute periods

The figures correspond to a sample of "ban" and "control" stocks as determined by the September 18 emergency order. The data corresponds to the first 13 trading days of September (09/02/2008-09/18/2008).
Short selling ratio for each five minute period is calculated by dividing the short sale volume by total volume for each stock. A stock is classified as large cap if the market capitalization on December 31 2007 is above $12.4 billions. Mid cap stocks are those with market capitalization between $12.4 billions and $440millions. Stocks are classified as small cap if the market capitalization on December 31 2007 is below $440 millions.

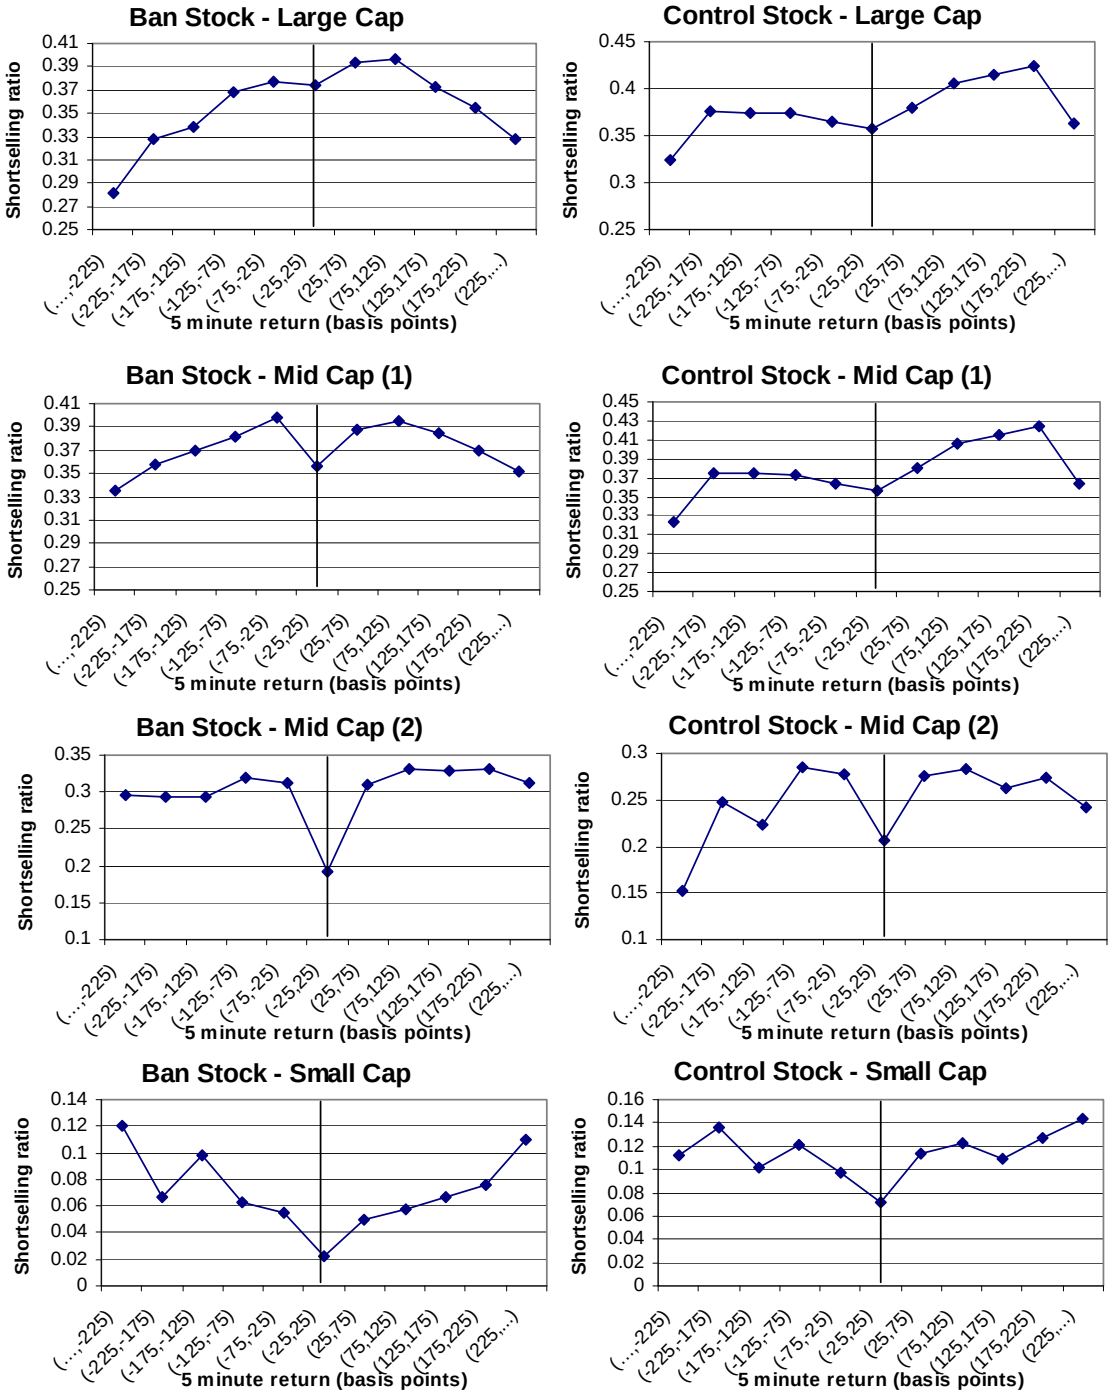

Figure 2:

Short selling ratio and return levels – 30 minute periods

The figures correspond to a sample of "ban" and "control" stocks as determined by the September 18 emergency order. The data corresponds to the first 13 trading days of September (09/02/2008-09/18/2008).
Short selling ratio for each 30 minute period is calculated by dividing the short sale volume by total volume for each stock. A stock is classified as large cap if the market capitalization on December 31 2007 is above $12.4 billions. Mid cap stocks are those with market capitalization between $12.4 billions and $440millions. Stocks are classified as small cap if the market capitalization on December 31 2007 is below $440 millions. Statistical significance of the differences are indicated by * for significance at the 10% level, ** for significance at the 5% level and *** for significance at the 1% level.

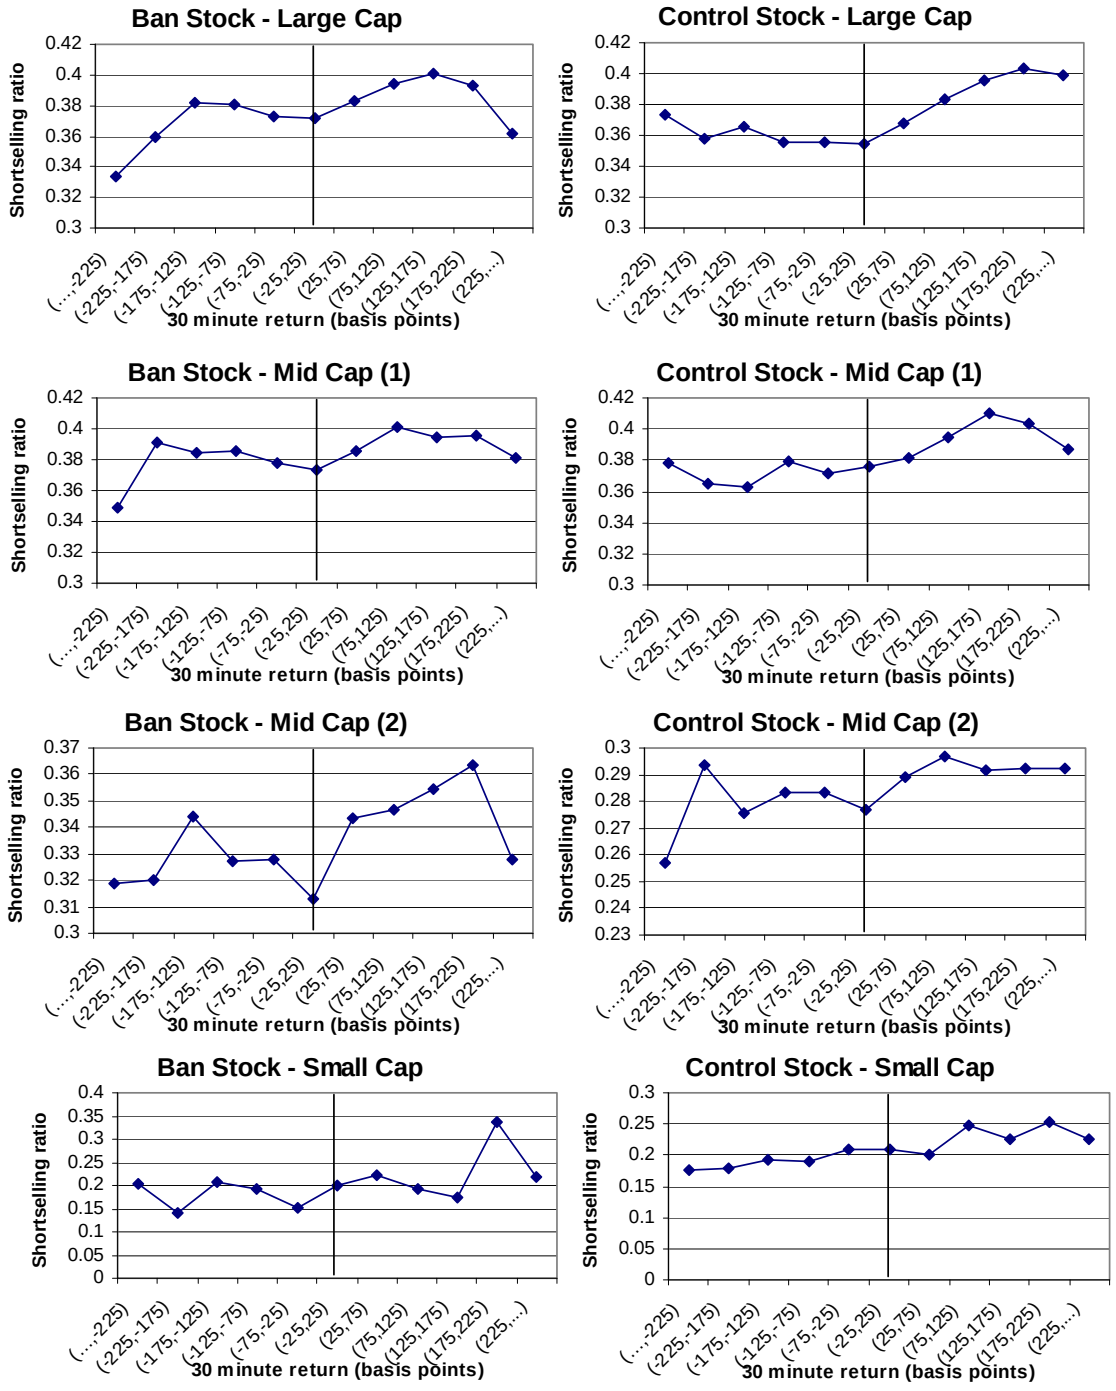

Table 1
Returns, volume and short sales

A five minute period is classified as a low return period of the corresponding return is below -2 times the standard deviation of the five minute return for that stock for the sample trading days. A five minute period is classified as a high return period of the corresponding return is above 2 times the standard deviation of the five minute return for that stock for the sample trading days. The data corresponds to a sample of "ban" and "control" stocks as determined by the September 18 emergency order. It covers the first 13 trading days of September (09/02/2008-09/18/2008). Short sale ratio for each 5 minute period is calculated by dividing the short sale volume by total volume for each stock. A stock is classified as large cap if the market capitalization on December 31 2007 is above $12.4 billions. Mid cap (1) stocks are those with market capitalization between $12.4 billions and $440millions. Mid cap (2) stocks are those with market capitalization between $440 millions and $102millions. Stocks are classified as small cap if the market capitalization on December 31 2007 is below $102 millions. Statistical significance of the differences are indicated by * for significance at the 10% level, ** for significance at the 5% level and *** for significance at the 1% level.

Short sale ratio

Table 2
Returns and price pressure

This table shows the results for contemporaneous price pressure order imbalance in the five minute interval after an extreme positive/negative return interval. A five minute period is classified as a low return period of the corresponding return is below -2 times the standard deviation of the five minute return for that stock for the sample trading days. A five minute period is classified as a high return period of the corresponding return is above 2 times the standard deviation of the five minute return for that stock for the sample trading days. The data corresponds to a sample of "ban" and "control" stocks as determined by the September 18 emergency order. It covers the first 13 trading days of September (09/02/2008-09/18/2008). The price pressure order imbalance for each five minute interval is calculated by dividing the difference between the buyer- and seller- initiated trade volume by total trading volume within each five minute interval. A higher or less negative number suggests less price pressure. A stock is classified as large cap if the market capitalization on December 31 2007 is above $12.4 billion. Mid cap (1) stocks are those with market capitalization between $12.4 billion and $440million. Mid cap (2) stocks are those with market capitalization between $440 million and $102million. Stocks are classified as small cap if the market capitalization on December 31 2007 is below $102 million. Statistical significance of the differences are indicated by * for significance at the 10% level, ** for significance at the 5% level and *** for significance at the 1% level.

Economic Analysis of the Short Sale Price Restrictions under the Regulation SHO Pilot

A Study by the Staff of the Office of Economic Analysis[1]

I Introduction

A. Background

Short selling in exchange-listed stocks ("Listed Stocks") in the U.S. has been subject to a "tick test" since 1938. Rule 10a-1 under the Securities Exchange Act of 1934 allows short sales to occur only at an uptick or a zero uptick (also known as a "zero-plus tick") for Listed Stocks. That is, short sales in Listed Stocks may be effected above the last trade price or at the last trade price if the last trade price is higher than the most recent trade at a different price.[2] Prior to August 1, 2006, Nasdaq was not operating as an exchange and, therefore, its stocks were not Listed for the purposes of Rule 10a-1. However, in 1994, the National Association of Securities Dealers ("NASD") introduced a "bid test" for Nasdaq National Market Stocks ("Nasdaq NM Stocks"), which applies to trading on Nasdaq and trading reported to the NASD. This rule, the former NASD Rule 3350, specifies that whenever the bid is a downtick from the previous bid, traders other than market makers may sell short only at prices one penny above the bid.[3] Within this report, the tick test and bid test will be described more generally as "price restrictions."

---

[1] For further information please contact Amy Edwards (edwardsa@sec.gov), Stewart Mayhew (mayhews@sec.gov), Tim McCormick (mccormickt@sec.gov), or Allan Zebedee.

[2] Paragraph (a) of Rule 10a-1 governs short sales of any security registered on, or admitted to unlisted trading privileges on, a national securities exchange if such transactions are made pursuant to an effective transaction reporting plan as defined in Rule 600 of Regulation NMS. Unless a specific exemption applies, short sales are prohibited at a price that is either (1) below the last reported price of a transaction reported pursuant to an effective transaction reporting plan (known as a "minus tick"); or (2) at the last reported price if that price is lower than the last reported different price (known as a "zero-minus tick").

[3] When Nasdaq began operating as a national securities exchange, NASD Rule 3350 was replaced by Nasdaq Rule 3350 for Nasdaq NM stocks traded on Nasdaq, and NASD Rule 5100 for Nasdaq NM stocks traded over-the-counter and reported to a NASD facility. In connection with Nasdaq commencing operations as a national securities exchange the Nasdaq National Market was renamed to the Nasdaq Global Market and Nasdaq NM stocks were renamed Nasdaq Global Market stocks. See NASD Rule 4200(a)(6) (providing that the Nasdaq Global Market is the successor to the Nasdaq National Market); see also Securities Exchange Act Release No. 54071 (June 29, 2006),

In July 2004, the Securities and Exchange Commission (the "Commission" or the "SEC"), adopted Regulation SHO, which contains Rule 202T, allowing the Commission to establish, by separate order, a pilot program to examine the efficacy of price restrictions.[4] At the same time, the Commission issued an order ("Pilot Order") establishing a pilot program ("Pilot") exempting a third of the stocks in the Russell 3000 Index ("Russell 3000") from all price restrictions.[5] The pilot stocks constitute a sample of Russell 3000 stocks that is stratified across average daily trading volume levels within each of three groups, corresponding to New York Stock Exchange ("NYSE,") Nasdaq, and American Stock Exchange ("AMEX") issues.[6] The Pilot went into effect on May 2, 2005, and was scheduled to end on April 28, 2006,[7] but has been extended to August 6, 2007 to allow the Commission to consider potential rulemaking after evaluating the results of the Pilot.[8]

The Pilot was designed to enable the Commission and the broader community to evaluate whether the price restrictions have a substantive impact on market quality, and more generally to achieve a deeper understanding of how price restrictions affect the trading process. In its Pilot Order, the Commission provided further explanation for the Pilot:[9]

> The Pilot will enable us to obtain empirical data to help assess whether short sale regulation should be removed, in part or in whole, for actively-traded securities, or if retained, should be applied to additional securities. The Pilot will allow us to study trading behavior in the absence of a short sale price test on the stocks selected by comparing the trading behavior of the control group stocks to that of

---

71 FR 38922 (July 10, 2006) (File No. SR-NASD-2006-068). For purposes of this study, we refer to Nasdaq NM stocks as Nasdaq NM or Nasdaq Stocks and not Nasdaq Global Market stocks. Prior to Nasdaq commencing operations as an exchange, Nasdaq securities traded on exchanges on an unlisted trading privileges basis were not subject to any price restriction.

[4] See the adopting release, SEC Release No. 34-50103, July 28, 2004.

[5] See the first Pilot Order, SEC Release No. 34-50104, July 28, 2004.

[6] Stocks were selected for this sample by sorting the 2004 Russell 3000 first by listing market and then by average daily dollar volume from June 2003 through May 2004, and then within each listing market, selecting every third company starting with the second.

[7] SEC Release No. 34-50747, November 29, 2004.

[9] SEC Release No. 34-50104, July 28, 2004.

> the Pilot stocks through empirical analysis. We will examine, among other things, the impact of price tests on market quality (including volatility and liquidity), whether any price changes are caused by short selling, costs imposed by a price test, and the use of alternative means to establish short positions.

To the extent that price restrictions have discernable effects, these should appear as differences between the pilot stocks, which the Commission selected to be a representative subsample of the Russell 3000 index, and the rest of the Russell 3000, which serve as control stocks. The results observed from the Pilot will help inform any subsequent rulemaking that the Commission may consider at the conclusion of the Pilot.

B. Overview

The goal of this study is to examine whether eliminating price restrictions has had any impact on market quality, broadly defined. We compute and compare various market statistics for pilot and control stocks both before and during the Pilot. The pilot stocks and control stocks are statistically similar prior to the Pilot. The analysis is conducted separately for both Listed Stocks and for Nasdaq NM Stocks to help distinguish the tick test from the bid test.

We designed this study to evaluate the various policy alternatives outlined in the first Pilot Order.[10] For example, the results of the Pilot might suggest eliminating all price restrictions, extending a uniform test to all securities, or removing price restrictions for a subset of stocks. Any of these alternatives would potentially affect not only the stocks in the Russell 3000, but others that have a lower market capitalization and perhaps are less actively traded than those in the pilot study. Price restrictions may have different effects for larger and smaller market capitalization stocks, or for more actively traded and less actively traded stocks. Accordingly, as part of our comparison of pilot and control stocks, we partition the sample into

[10] See SEC Release No. 34-50104, July 28, 2004.

groups based on market capitalization and turnover (trading volume divided by shares outstanding). The results for the smallest and least actively traded stocks within the Russell 3000 would be the most informative about the likely impact of price restrictions for those stocks that are not in the Russell 3000. Moreover, comparing large and small stocks (or high and low volume stocks) within the Russell 3000 should reveal whether any effects of the price restrictions are related to size or volume.

This study investigates various hypotheses relating to the potential effects of price restrictions. First, if price restrictions represent an economically meaningful constraint on short selling, they may induce some traders to avoid short selling or to reduce the size of their short positions. Thus, we test whether the level of short trading volume and short interest are significantly different for pilot and control stocks.[11] Both for Listed Stocks and Nasdaq NM Stocks, we find that price restrictions reduce the volume of executed short sales relative to total volume, indicating that price restrictions indeed act as a constraint to short selling. However, in neither market do we find significant differences in short interest across pilot and control stocks.

To the extent that price restrictions are applied in some markets and not in others trading the same stocks, traders who find the restrictions binding might avoid the constraint by choosing a venue where the constraint is not applied. Specifically, because not all markets that trade Nasdaq NM Stocks apply the Nasdaq Bid Test, short sellers can route their orders to avoid the rule. Removing the rule eliminates the need to avoid it and therefore might affect where short sales in Nasdaq NM Stocks are executed. Our results indicate that Nasdaq's share of short selling volume is negatively impacted by price restrictions, suggesting that some short sellers are routing orders to avoid price restrictions.

[11] Short interest is the total number of shares of a security that have been sold short and have not yet been repurchased.

Additionally, traders can avoid price restrictions by synthetically shorting in the option market rather than shorting the stock.[12] To measure the extent to which price restrictions drive short sellers to the option market, we compare option market trading activity for pilot and control stocks. We find no evidence that short sale price restrictions in equities have an impact on option trading or open interest.[13]

Regardless of whether price restrictions have any substantive impact on overall market liquidity or inhibit manipulation, they affect the ability of short sellers to demand liquidity by getting prompt execution of market orders. For purely mechanical reasons, we would expect price restrictions to affect the number of trades occurring on downticks vs upticks, and the percentage of time the market is in an upbid or downbid state. For Listed Stocks, we find that the application of the tick test results in significantly fewer than 50% of transactions occurring on downticks or zero downticks, while trading is more balanced when the tick test does not apply. For Nasdaq NM Stocks, we find that the percentage of time the market is in a downbid state declines when the bid test is removed, suggesting that downbids occur more regularly when the bid test applies.

To the extent that price restrictions inhibit the free movement of stock prices, they might make markets less liquid. On the other hand, because short sellers can rarely execute against a bid quotation, price restrictions force short sellers to act more like liquidity suppliers than liquidity demanders. Therefore, removing them might decrease the perceived supply of liquidity. To test whether price restrictions have a more general impact on liquidity or volatility, we compare quoted and effective spreads, intraday volatility, and the daily price range across

[12] A synthetic short position can be achieved by buying a put option and writing a corresponding call option in the same security. The term synthetic refers the fact that you can replicate the payoffs of an equity short sale without actually short selling the equity itself.
[13] Open interest is the total number of options contracts that have not yet been closed or fulfilled by delivery.

pilot and control stocks. We find that quoted depths are augmented by price restrictions but realized liquidity is unaffected. Further, we find some evidence that price restrictions dampen short term within-day return volatility, but when measured on average, they seem to have no effect on daily return volatility.

Finance theory predicts that under certain conditions, constraints on short selling may cause securities to be misvalued by the market, particularly when investors have highly divergent opinions about the stock.[14] A simple argument is that short sale constraints make it more costly for those investors who have a negative opinion of a stock to trade on their beliefs, and thus, their views may be reflected less in the stock price than those who have a positive view. Under more general assumptions, theoretic models predict that short sale constraints can cause stocks to be either overvalued or undervalued.[15] To test whether price restrictions constitute an economically consequential short sale constraint that influences equilibrium stock prices, we investigate whether the prices of pilot stocks react in response to the removal of the rule. We find that for Listed Stocks, control stocks outperform pilot stocks on average by about 24 basis points on the first day of the Pilot, suggesting that the tick test may cause stocks to be slightly overvalued. For Nasdaq NM Stocks, no significant return differential was observed surrounding the initiation of the pilot. We also examine stock returns for a six-month period following the initiation of the pilot program, to ascertain whether the elimination of price restrictions has had any discernible effect on stock prices over a longer horizon. We find that pilot stocks and control stocks have similar returns over this horizon, but some tests show weak evidence consistent with the hypothesis that price restrictions facilitate over-pricing. In the absence of price restrictions, prices do not rise as much as with price restrictions, leading to a lower equilibrium price.

[14] See, for example, Lintner (1969), Miller (1977), and Scheinkman and Xiong (2003).
[15] See Gallmeyer and Hollifield (2006).

SEC_OEA_FCIC_001285

One view of price restrictions is that they help prevent "bear raids," or that they make it more difficult for would-be manipulators to drive prices down below their true values. On the other hand, price restrictions might also make it more difficult for short sellers to move prices back toward their true value in response to upward manipulations. Because price restrictions are inherently short-term constraints, any substantive impact on the susceptibility of securities to manipulation is most likely to be manifest at short horizons. For this reason, we focus our investigation on price patterns that might indicate manipulative behavior at a daily or intraday frequency. To explore these issues, we proceed along three avenues of investigation.

First, to the extent that price restrictions create an environment less conducive to price patterns that might indicate downward manipulation and more conducive to price patterns that might indicate upward manipulations, we might expect to observe more extreme negative returns, and fewer extreme positive returns, for pilot stocks than for control stocks. To investigate this, we use our control-sample methodology to test whether the skewness of the returns distribution of short-horizon returns differs across pilot and control stocks.[16] Our results indicate no statistically significant impact of the pilot program on return skewness, measured at five-minute, thirty-minute, or one-day return intervals.

Second, we identify positive and negative price "spikes," or instances when extreme price moves are reversed shortly afterwards, and examine whether the frequency of positive and negative spikes differs across pilot and control stocks. We find that at a short (five-minute) horizon, pilot stocks tend to experience more price reversals than control stocks, but that this result is the same for negative and positive price reversals. At a thirty-minute horizon, we find no evidence that there are more price reversals for pilot stocks than control stocks.

[16] Bris, Goetzmann, and Zhu (2004), in a study of the effects of short sale regulations around the world, find evidence suggesting that short selling constraints can affect the skewness of the returns distribution.

SEC_OEA_FCIC_001286

Third, we use a time-series regression methodology to measure the extent to which positive and negative price changes are likely to be subsequently reversed. If price rules play an important role in preventing short sellers from temporarily driving prices down below their fair value, we would expect to see a larger portion of negative returns subsequently reversed for the pilot stocks than the control stocks. For Listed Stocks, we find that a larger portion of both negative and positive returns are subsequently reversed for pilot stocks than control stocks at a short (five-minute) horizon. The symmetry of these results is consistent with the increase in volatility discussed above rather than any marked increase in the potential for downward price pressure. On the other hand, a marked increase in the potential for downward price pressure relative to upward price pressure should lead to an asymmetry in positive and negative return reversal results. We do not find this asymmetry. At a thirty-minute horizon, we find no statistically significant difference in the magnitude of return reversals for Listed pilot and control stocks. For Nasdaq NM Stocks, we find no statistically significant difference in the magnitude of return reversals for pilot and control stocks for either five-minute or thirty-minute intervals.

One important element of the Pilot is the ability to examine whether the tick test affects stocks of varying sizes and volume differently. For example, does the tick test affect larger stocks in the same manner as smaller stocks and would the tick test be more effective for large or small stocks? To examine these questions, we divide the stocks into size, measured as market capitalization, and volume, measured as trading volume divided by shares outstanding (turnover), groups and run each of our tests again for each group. For most of our tests, we find that the tick and bid tests affect stocks the same no matter how large or small or how active are the stocks. In particular, we find that the tick and bid tests result in a lower percentage of short sale volume for most size and activity levels. We also find that the tick and bid tests result in

lower bid and ask depth for most size and activity levels. Thus, the bid and tick tests do not affect liquidity in a way related to the size or activity level of a stock. Finally, the tick and bid tests do not affect returns at or following the start of the Pilot whether the stocks are large or small. On the other hand, the size and activity levels appear to matter for the effect of price restrictions on volatility and for routing decisions. The bid test affects routing decisions more in smaller stocks. Likewise, the bid and tick tests dampen permanent price volatility in small stocks while amplifying it in large stocks.

The remainder of this report is organized as follows. In section II, we recount the history of price restrictions, including Regulation SHO. Section III contains an overview of the academic literature relating to the tick test and the bid test. The data and construction of the samples are described in section IV. Section V explains the empirical methods used in the analyses. In section VI, we present our main analysis of the effect of removing price restrictions for pilot and control stocks over the first 6 months of the Pilot Period. More specifically, in section VI-A, we present our analyses of how eliminating price restrictions has affected the overall level of short volume and short interest, option market volume and open interest, and the frequency and duration of upticks or upbids within the day. In section VI-B, we present our analysis of how the removal of price restrictions has affected market quality, including measures of spreads and intraday volatility. In section VI-C, we report our results on whether lifting price restrictions has affected underlying stock prices or returns, the skewness of returns distributions, the incidence of positive and negative spikes, and the tendency of positive and negative shocks to subsequently reverse. In section VII, we investigate whether price restrictions affect all stocks similarly or whether certain types of stocks, such as small stocks, are more affected by the rules. Section VIII summarizes and concludes the report.

II History of Price Restrictions

This section briefly summarizes the historical background of the price restriction rules.[17] After the market crash of 1929, a popular view emerged that short sellers exacerbated the crash.[18] Public concerns about short selling became particularly acute in the aftermath of the international currency crisis of September 21-22, 1931, prompting Senator Arthur Capper of Kansas to introduce several bills aimed at restricting and taxing short selling. It was in this environment, on October 6, 1931, that the NYSE required that all sell orders must be marked long or short.[19] According to Meeker (1932, p. 147), this effectively acted as a rule against shorting on a downtick, as such trades were viewed as violations of the Exchange's rule against "demoralizing" trades.[20]

Shortly after its creation in 1934, the Commission recommended sixteen rules that all national securities exchanges should adopt. Among them was a recommendation for an explicit rule against shorting on a downtick:

> No member shall use any facility of time exchange to effect on the exchange a short sale of any security in the unit of trading at a price below the last sale price of such security on the exchange.[21]

Exceptions were specified for odd-lot trading and to allow regional exchanges to bring their prices in line with the primary exchange. Sixteen exchanges adopted this rule in 1935.[22]

Following sharp price drops in the fall of 1937, the Commission performed a study of the transactions of 20 securities on the NYSE for the periods September 7-13 and October 18-23 of that year[23] and found that short sales constituted a significant portion of the transactions in the declining market. The Commission adopted new short-selling rules, including a rule to formally define what is meant by a short sale and Rule 10a-1, the tick test.[24] This version of the tick test prohibited short sales "at or below the price at which the last sale, regular way, was effected on such exchange." The rule was adopted on January 24, 1938 and went into effect February 8, 1938.

The tick test was amended March 10, 1939 to allow for short selling at a zero uptick, or in other words at the last trade price, "provided that the last sale price was higher than the last different price which preceded it."[25] Certain exemption letters have been granted over the years, such as the exemption for diversified exchange traded funds.[26] However, the basic structure of this rule has remained essentially unchanged since 1939.

The Commission's Special Study (1963) identified three objectives of the tick test, which have been consistently used by the Commission as a framework for discussing the effectiveness of the regulation. These objectives are that the rule should:

(1) Allow relatively unrestricted short sales in an advancing market;
(2) Prevent short selling at successively lower prices, thus eliminating short selling as a tool for driving the market down; and
(3) Prevent short sellers from accelerating a declining market by exhausting all remaining bids at one price level, causing successively lower prices to be established by long sellers.

In 1976, the Commission proposed three alternative temporary rules that would have suspended the tick test for some or all registered securities.[27] In response to the proposal, several market participants, including the NYSE, opposed the proposal, and expressed concerns that abolishing the tick test might lead to increased volatility or decreased liquidity. The Commission withdrew the proposals in 1980.[28]

A House Report submitted by the Committee on Government Operations dated December 6, 1991 discusses several aspects of short selling, including the tick test.[29] The report suggests that short selling has negative price effects that "can have important and lasting consequences" and asserts that the tick test is "effective in stabilizing the market for exchange-listed stocks for the benefit of issuers and investors," although no evidence is cited in support of this view. The report also recommends that the tick test should be extended to the Nasdaq market.

On September 6, 1994, the Commission approved NASD Rule 3350 (the "bid test") as a temporary rule.[30] This created a bid test for trades executed by NASD members or their customers, but with exemptions for both equity and option market makers. Specifically, this rule prohibited short sales at or below (or less than one penny above) the best bid price whenever the prevailing inside bid price is lower than the previous inside bid. The bid test might appear less restrictive than the tick test, because it allows for unrestricted short selling at any price when the bid price is higher than the previous bid, and because of the market maker exemptions. Since its

[30] See SEC Release No. 34-34277, July 6, 1994.

initial approval, the bid test has been re-approved annually as a temporary rule.[31] The bid test was in effect when Regulation SHO became effective in January 2005. When Nasdaq began operating as an exchange in August 2006, NASD Rule 3350 was replaced by Nasdaq Rule 3350 and NASD Rule 5100.[32]

The Commission re-opened the discussion on Rule 10a-1 in a concept release dated October 20, 1999.[33] In this release, the Commission requested comment on numerous issues surrounding the tick test, including:

- whether the tick test should be suspended when the daily stock return is above a threshold level;
- whether actively traded securities should be exempted from the tick test;
- whether the restrictions should apply only around certain market events such as at the open and close, around mergers and acquisitions, or at option expirations;
- whether hedging transactions be exempt from the tick test;
- whether the tick test should be revised in response to expanded after-hours trading or decimalization;
- whether the tick test should be extended to non-exchange-listed stocks; and,
- whether the tick test should be eliminated.

In October 2003, the Commission proposed a rule that would create a uniform bid test that would apply to both Listed and Nasdaq NM Stocks, with various exemptions.[34] In addition, the Commission proposed a pilot program that would suspend the tick test for actively-traded securities for two years.[35] As stated in the proposing release, "[t]he temporary suspension would allow the Commission to study the effects of relatively unrestricted short selling on market volatility, price efficiency, and liquidity."[36]

[31] Most recently, see SEC Release No. 34-53093, January 10, 2006.
[32] Nasdaq NM stocks are currently trading under an exemption from Rule 10a-1 in order to maintain the status quo until the conclusion of the Pilot or any further rulemaking by the Commission.
[33] See SEC Release No. 34-42037, October 20, 1999.
[34] See SEC Release No. 34-48709, October 28, 2003.
[35] See SEC Release No. 34-48709, October 28, 2003.
[36] See SEC Release No. 34-48709, October 28, 2003.

With the adoption of Regulation SHO in July 2004, the Commission decided to defer consideration of the uniform bid test and the proposed exemptions (proposed Rule 201), in order to first observe the results of the pilot program.[37] In connection with the establishment of a Pilot, the parameters governing a Pilot were expanded to include a broader spectrum of securities than envisioned in the proposing release, and the length of the Pilot was shortened to one year. As stated in the adopting release,

> the purpose of the Pilot is to assist the Commission in considering alternatives, such as: (1) eliminating a Commission-mandated price test for an appropriate group of securities, which may be all securities; (2) adopting a uniform bid test, and any exceptions, with the possibility of extending a uniform bid test to securities for which there is currently no price test; or (3) leaving in place the current price restrictions.

The details of the program, including the list of securities included in the Pilot, were specified in the Commission's Pilot Order of July 28, 2004.[38] The Pilot was originally scheduled to begin on January 3, 2005 and last for one year. However, because the industry needed more time to prepare their systems, the start date was postponed until May 2, 2005, and later, the terminal date of the Pilot was extended until August 6, 2007 to maintain the status quo for pilot stocks until the Commission evaluates the results of the study and considers potential rulemaking on price restrictions.[39] The Pilot Order suspends Rule 10a-1 and the bid test for approximately a third of the Russell 3000 stocks. The methodology for selecting the pilot stocks is detailed in the Pilot Order, and is summarized in section IV, below.

III Previous Evidence

The previous evidence on price restrictions gives us insight into how price restrictions work. In particular, it examines the effectiveness of the rules and the effect that the rules have on

[37] SEC Release No. 34-50103, July 28, 2004.
[38] SEC Release No. 34-50104, July 28, 2004.
[39] SEC Release No. 34-53684, April 20, 2006.

market quality. We are unaware of a previous study that compares the tick test to the bid test. Several concurrent studies also examine the effect of the Pilot on the tick and bid tests (Alexander and Peterson (2006), Bai (2006), Diether, Lee, and Werner (2006), and Wu (2006)). These studies are summarized on Appendix A.

A. Effectiveness of the Rule

1. Shorting in a Declining Market

Several studies examine whether the rules appear to keep short sales from executing in declining markets. When Rule 10a-1 was adopted in 1938, it was motivated in part by a Commission study of short selling, based on two weeks of data in 1937. This study found that when a downtick rule applied, a substantial amount of short selling occurred during periods when the market was declining.[40] Two subsequent studies produced by staff at the Commission found that the tick test allows short selling in declining markets.[41] The Commission's 1963 Special Study concluded that Rule 10a-1 was not effective at achieving its objectives, stating that

> [p]resent rules appear inadequate to relieve the added pressure that short selling may create during a severe decline in the general market or a declining price trend in a particular security. Despite the rules, a relatively large volume of short selling occurred in particular stocks, including "market leaders" and "trading favorites," during the period of decline preceding the market break of May 28, 1962, and at critical junctures on that day, and many additional opportunities existed when short selling could have occurred.[42]

In a more recent study, Ferri, Christophe, and Angel (2004) examine short selling in a matched sample of Nasdaq National Market stocks, which were subject to the bid test, and Nasdaq SmallCap stocks, which were not, during a period of high volatility and rapidly declining

[40] The NYSE had a downtick rule prior to the Commission's tick test. A downtick rule is a weaker form of the tick test because it allows trading at the most recent price even if that price was a downtick.
[41] The Securities and Exchange Commission (1963), in the Special Study, examined the trading activity leading up to and during the market break of May 28, 1962. In a working paper by SEC staff, Marcotte and Martin (1977) study the tick test for the period from September 20 through October 15, 1976, during which time the Dow Jones Industrial Average fell by 8.12%. The results are summarized in Pollack (1986).
[42] 88th Congress, HR Doc No 88-95 (1st session, 1963), pp. 293-294.

stock prices (September 2000-August 2001). In their sample of 2,275 observations, they find no significant differences in the overall level of short selling, or the frequency of days with abnormally negative returns and abnormally high short selling.

Overall, the research above shows that short sales are executed in declining markets despite the application of the tick or bid tests. However, this does not mean that short sales are unaffected by the tick and bid tests. We discuss this further in the next section.

2. Short Sale Execution Quality

Another area of research examines whether these rules harm the execution quality of short sales by reducing the prices received by short sellers, by delaying the execution of short sales, or by reducing the fill rates.

Martin and Marquette (1977) conduct a simulation calibrated to the Dow 30 stocks, to estimate the degree to which the rule would have affected execution prices for market short sale orders submitted during a period of market decline. The simulation results indicate that even during a period of rapid price declines, randomly arriving short market orders would have executed at higher prices as a result of the uptick rule. Therefore, short sellers appear better off because of the tick test.

Albert, Smaby, and Robison (1997) examine the negative abnormal returns to stocks following large increases in reported short interest, as an estimate of the profitability of short selling. They find that short selling was more profitable for their Listed sample than their Nasdaq sample during a period (1987-1991) when only Listed Stocks were subject to a price restriction. Their findings imply that the uptick rule does not have a significant negative impact on the bottom line for short sellers.

While studying order data from the NYSE, Angel (1997) and Alexander and Peterson (1999) find that the tick test prevents short sales from demanding liquidity more than 90% of the time. As expected, the degree to which the tick test is binding depends on whether the market is rising or falling. Likewise, McCormick and Reilly (1996) find that the Nasdaq bid test prevents short sellers from demanding liquidity roughly 35% of the time. This proportion was found to be an increasing function of trading volume and, not surprisingly, a decreasing function of the day's stock return.

Both Angel (1997) and Alexander and Peterson (1999) conclude that Rule 10a-1 significantly impedes order execution quality for short sales, even in rising markets. For those cases where the stock price increased, short sellers can trade at the bid less than fifteen percent of the time. According to Alexander and Peterson (1999), the tick test appears to contradict the Commission's first stated objective for short selling regulation, to "allow relatively unrestricted short selling in an advancing market."

In addition, Alexander and Peterson (1999) also found that short sale orders have significantly lower execution rates and significantly longer times to execution than regular sales. Alexander and Peterson (2002) study how the tick test was affected by the reduction of the tick size from 1/8 to 1/16 in June 1997. As predicted, their evidence suggests that short sales were executed faster and at better prices after the reduction in tick size, confirming that the tick test is less binding when the tick size is smaller.

In summary, previous research shows that short sellers can receive better prices as a result of the tick test and that the tick test does not impede profit opportunities. However, the tick test and bid test restrict the ability of short sellers to demand liquidity even in rising markets.

This results in execution delays and lower fill rates. Tick size changes have lowered these costs, but short sellers are still precluded from demanding liquidity much of the time.

3. Manipulation

Many of the studies that examine the ability to short in a declining market do not address the question of whether short selling in a declining market increases the potential for manipulating a stock price below its fair value, or conversely, whether short selling helps prices adjust more quickly to their efficient values. Nor do the studies address the question of whether a tick test or bid test would have been effective at reducing the amount of short selling during declining markets. A few early studies of short selling in the 1930s concluded that there was no evidence that short sales had any material effect on the magnitude of price swings.[43]

Ferri, Christophe, and Angel (2004) come a little closer to questioning whether the bid test inhibits trading that may be indicative of manipulation. On days when stock prices are declining, the degree of short selling is positively related to returns for Nasdaq SmallCap stocks, which are not subject to the bid test, but not for matching Nasdaq NM stocks, which are subject to the bid test. This result is the reverse of what one would expect to see if the bid test helps prevent short sellers from pushing down prices. The authors conclude that "a bid test is unnecessary for investor protection."

B. Effect on Market Quality

Because the tick and bid tests appear to have some impact on the execution of short sales, even though short sales can still execute in declining markets, we might expect the tick and bid test to affect market quality. In a recent working paper, Jones (2003) re-examines the period surrounding the initiation of the tick test in the 1930s. He finds a significant reduction in bid ask

[43] See Twentieth Century Fund (1935), Macaulay and Durand (1951).

spreads and positive abnormal stock returns surrounding the initiation of the downtick rule on October 6, 1931, with no significant changes in trading volume, volatility, or the price impact of trades. He also finds similar results surrounding the initiation of Rule 10a-1 1938. He concludes that

> [b]ecause the uptick rule no longer constrains shorting as much as it once did, any liquidity effects are likely to be much more modest than the ones identified in the 1930's. However, it would not be surprising if repeal of the uptick rule were to lead to some reduction in individual stock liquidity, particularly in less liquid stocks.[44]

In research sponsored by NASD, McCormick and Reilly (1996) find that the introduction of the bid test did not have a substantive impact on market quality, as measured by volatility and bid ask spreads. A more comprehensive follow-up study by McCormick and Zeigler (1997), which was also sponsored by the NASD, supports the original finding that the implementation of the bid test had little or no impact on market quality. They find that quoted and effective spreads were narrower in 1997 than in 1994, but they attribute the changes to a gradual improvement in market quality over time, and not to the implementation of the bid test. They find no significant change in quoted spreads as a result of the bid test. While they do find a statistically significant decline in effective spreads, this is a natural consequence of a rule that forces short sellers to act as liquidity suppliers rather than liquidity demanders. Because the improvement in effective spreads is coming at the cost of delayed executions, it does not necessarily signify an improvement in market quality.

Au-Yeung and Gannon (2003) estimate the joint dynamics of index and index futures returns in Hong Kong, surrounding the elimination of Hong Kong's uptick rule on March 25, 1996. Using a multivariate GARCH framework, they find evidence that Hong Kong's uptick

[44] This study was funded by the New York Stock Exchange.

SEC_OEA_FCIC_001298

rule was impeding price discovery on the index relative to the futures contract, and that conditional volatility for the index declined with the elimination of the uptick rule.

Overall, this evidence seems to indicate that tick tests can lead to narrower bid ask spreads, but impedes price discovery, while the bid test should not have any discernable effect on market quality. The construction of the Pilot study improves upon the design of these previous studies and allows us to study these issues in a more controlled environment.

IV Construction of the Samples

A. Selection of Pilot and Control Stocks

The stocks in the pilot sample are those specified in the Pilot Order.[45] Stocks were selected for this sample by sorting the 2004 Russell 3000 first by listing market and then by average daily dollar volume from June 2003 through May 2004, and then within each listing market, selecting every third company starting with the second. Because the selection process relied on average daily dollar volume, companies that had their initial public offering in May or June of 2004, just prior to the Russell reconstitution, were not included. The 32 stocks that are not listed on the NYSE, Amex, or Nasdaq NM were also excluded prior to sorting and selecting the pilot stocks.

While no companies have moved in and out of the Pilot, the pilot stocks might experience ticker symbol changes, listing changes, and mergers. We collected the necessary change information from NYSE, Amex, and Nasdaq, who keep track of and disseminate these changes. In the case of mergers between pilot and control stocks, the status of the resulting company is the same as the status of the company with the larger market capitalization of equity on the day prior to the first merger announcement. The pilot stocks that did not survive to the start of the Pilot on

[45] SEC Release No. 34-50104, July 28, 2004.

May 2, 2005 are not included in the analysis. Pilot stocks with listing changes during the Pilot are included in our analysis up until the date of the listing change.

The stocks in the control sample come from the remainder of the 2004 Russell 3000 not included in the Pilot. We do not include the stocks with initial public offerings after May 2004 because these stocks were not eligible to be selected for the Pilot. Like the pilot sample, the control sample stocks can experience corporate events that make tracking them difficult. We keep track of ticker symbol changes, listing changes, and mergers using the daily symbol directories from the Nasdaq Trader web site and using Bloomberg. As with the pilot sample, we include only the control stocks that survive until May 2, 2005 and include stocks that are subsequently delisted up until the delisting date.

Table 1 reports the sample sizes and breaks down the sample in various dimensions. As the table indicates, our sample contains 504 listed pilot stocks and 973 listed control stocks that are subject to Rule 10a-1 and 439 Nasdaq pilot stocks and 917 Nasdaq control stocks that are subject to NASD Rule 3350. Table 1 also indicates that roughly 70% of Listed Stocks and 63% of Nasdaq NM Stocks have listed options. Because listing affects the short sale rules applied to trading, we report results for sub-samples by listing market but not for the full sample. If an issuer switches its listing from Nasdaq to Amex or NYSE or vice versa after May 2, we keep that stock in the sample up until the day of the listing change. If an issuer changed its listing prior to May 2, it will be grouped according to its new listing and we include pre-period data only from that same listing.[46] Listings changes between Amex and NYSE do not affect our sample because the change does not affect the short sale rule applied.

[46] We exclude one stock that changed its listing on the first day of the pilot, Renasant Corporation RNST, formerly Peoples Holding Company, PHC.

Similarly, we keep stocks in our sample up until their last listed day even if they are acquired or otherwise move to markets that do not apply the same rule (i.e., move to the Nasdaq Capital Market, OTCBB, or the Pink Sheets) after May 2, 2005. We keep these stocks to avoid a survivorship bias, which is a bias associated with finding higher average returns than actually exist. We believe an analysis of the pilot would be particularly sensitive to survivorship bias and we therefore, make every effort to reduce it. Further, if an issuer moves its listing from Nasdaq to an exchange or from an exchange to Nasdaq, we keep the stock in the sample up until the list/delist date. We do this so that our analysis does not confuse the effects of the tick test with those of the bid test. Because we retain stocks in our sample until the stocks delist, our sample size on our last sample day (October 31, 2005) is smaller than our sample size on the first pilot day (May 2, 2005). In fact, we have about 88 fewer stocks in our sample on October 31 than we do on May 2. Despite the drop in sample size, the pilot stocks comprise about 1/3 of the sample stocks for both Listed and Nasdaq NM Stocks on October 31 as well as May 2.

B. Data and Sample Statistics

We examine these pilot and control stocks over a 210 day period in 2005. We examine the 82 day period from January 29 to April 29 as the Pre-Pilot Period during which the pilot and control stocks are subject to the same rules. The Pre-Pilot Period allows us to test whether the pilot and control stocks appear similar when they are subject to the same rule and it gives us a reference point to examine how the sample stocks change when the price restriction rules are removed. In the results section, this period is compared to the 128 day period from May 2, the first day of the pilot, to October 31, 2005.

Before comparing the Pre-Pilot Period to the Pilot Period, we first examine whether the pilot and control samples appear comparable over the Pre-Pilot Period. Table 2 gives this comparison separately for Listed and Nasdaq NM Stocks. The statistics are daily levels averaged over the Pre-Pilot Period. We use trade and quote data obtained from the Securities Industry Automation Corporation (SIAC) to estimate stock volume, price, spread, depth, and intraday returns, data from the Center for Research in Securities Prices (CRSP) to estimate market capitalization and daily returns, data from the Option Price Reporting Authority (OPRA) to estimate option volume and open interest, and the SRO Pilot data to estimate short selling levels.[47] Short interest, reported monthly, comes from the NYSE, Amex, and Nasdaq. Most of the measures in Table 2 are qualitatively similar for pilot and control stocks, according to a statistical t-test run at the 95% and 99% confidence levels (also stated as 5% and 1% significance levels). This evidence suggests that the two groups are a good match and supports the validity of further comparison of pilot and control stocks.

The statistics of Table 2 are divided into groups. The first group of statistics measures general stock characteristics such as volume, price, market capitalization, and short interest. The first three rows of Table 2 show that the pilot stocks have similar average volume to the control stocks whether volume is measured by the number of trades per day, the average daily share volume, or turnover. The average volume-weighted average price (VWAP) and average market capitalization diverge slightly. For both Listed and Nasdaq NM Stocks, the VWAP is higher for pilot stocks but the market capitalization is lower. Neither difference is statistically significant.

[47] The SRO Pilot data refers to the short selling records available from each of nine markets: American Stock Exchange, Archapelago Exchange (now a part of NYSE Group), Boston Stock Exchange, Chicago Stock Exchange, NASD, NASDAQ Stock Market (now NASDAQ Stock Exchange), New York Stock Exchange (now a part of NYSE Group), National Stock Exchange, and the Philadelphia Stock Exchange. This analysis aggregates the short selling data without regard to whether there exists a SIAC report for the short sale transaction.

The next group of statistics measures the level and nature of short selling. These statistics measure short interest, the short selling volume and location, and option volume and open interest. In Listed Stocks, short selling comprises about 24% of share volume and 27% of trades. The level jumps to 36% of share volume and 37% of trades in Nasdaq NM Stocks. Still, the level of short selling in pilot stocks is similar to that of control stocks prior to the start of the pilot. Because the bid test does not apply to all markets, we examine the share of short sales executed on Nasdaq to measure whether investors appear to be routing short sales away from Nasdaq. While we estimate this statistic for Listed Stocks as well, we focus on the Nasdaq NM Stocks for results. Rows ten to fifteen of Table 2 show that prior to the pilot, the pilot and control stocks have similar average option volume and open interest, statistically indistinguishable from each other.

The next set of statistics measures mechanical aspects of trading and quoting, in particular, the percentage of trades occurring on a downtick or zero downtick and the percentage of the day during which the last change in the bid was downward. These measures were selected because they both determine when a short sale can be executed and are influenced by the application of the price restrictions. Prior to the pilot, about 46% of trades in Listed Stocks occur on downticks or zero downticks, while slightly over 50% of trades in Nasdaq NM Stocks do. These percentages are similar for the pilot and control stocks. Likewise, the percentage of the day during which the most recent change in the bid was downward is similar for pilot and control stocks. For Listed Stocks, the most recent change in the bid was downward for about 39% of the day. This is indicative of the nature of a limit order book market to have short-lived liquidity imbalances followed by long periods of liquidity building. In other words, a large order quickly executes, removing several price levels in the limit order book, followed by a slow replenishing

of the limit order book. In the Nasdaq market, which operates more like a dealer market than the listed market, stocks spend more time in a downbid situation, about 47% of the time.

Liquidity is the next important group of statistics. We measure displayed liquidity using quoted and effective spreads measured in absolute terms and also relative to prices, and using aggregated quoted ask and bid depth at the National Best Bid and Offer (NBBO). We measure realized liquidity using the NBBO for both Listed and Nasdaq NM Stocks. Like the earlier measures, the liquidity measures show that the pilot and control stocks are statistically similar for all measures. While the magnitude of some of the measures, particularly the quoted ask depth and quoted bid depth, appears higher for control stocks than for pilot stocks, the measures are actually statistically similar.

The final group of statistics gives the distribution of returns and prices over various periods. Table 2 gives average returns, average absolute returns, the skewness of the returns, and the variance of the returns over 5 minute, 30 minute, and 1 day periods. It also shows the daily price range and three variance ratios. The variance ratios measure the transitory volatility by comparing the variance of returns measured over short and long horizons. Overall, the pilot and control samples are statistically similar in the means, skewness, and transitory and total volatility. It is interesting to note that the returns for all samples and all horizons are positively skewed. This positive skewness has been documented in previous work, which associates the result with short selling restrictions.

V Methods

A. Comparing Pilot and Control Stocks

We derive the results in this report using several empirical approaches. The first approach compares the pilot sample to the control sample both before and after the start of the pilot. The approach allows us to apply a standard t-test to the difference of the differences. As long as the pilot and control samples are generally well constructed, this approach will control for changes in market conditions that are unrelated to the pilot. However, this approach may not fully control for differences within the samples. Further, it is cumbersome when examining the differential effect of the pilot on sub-samples. Therefore, we will also employ a regression approach.

The regression approach includes multiple test variables at the same time and also controls for unforeseen differences between the pilot and control samples. Because the number of stocks changes over the sample period, we employ daily cross-sectional regressions for each sample day after the start of the pilot and then we average the coefficients. We employ variations on the following regression:

$$\text{Market Quality}_i = \alpha + \beta_1 \text{Pilot}_i + \beta_2 \text{Pre Pilot Market Quality}_i \quad (1)$$

where Market Quality is one of several dependent variables (e.g., effective spread) measured for each stock on one trading day, Pilot is equal to one for pilot stocks and zero for other stocks, and Pre-Pilot Market Quality is the average daily level of the dependent variable measured over the Pre-Pilot Period. If the dependent variable is generally larger for pilot stocks than control stocks, then β_1 will greater than zero. If this relation is persistent across time, then the average β_1 will be greater than zero. The Pre-Pilot Market Quality variable helps ensure that the coefficients on the

indicator variables measure the effect of removing price restrictions. It also helps to control for any unforeseen differences between the pilot and control stocks.

We run all tests separately for stocks listed on an exchange and stocks listed on Nasdaq NM because the rule applied to trading of Nasdaq NM Stocks is different than the rule applied to the trading of stocks listed on exchanges.[48] This allows us to satisfy one purpose of the Pilot, which is to clearly distinguish the effect of each type of rule.

B. Behavior of Stock Prices Surrounding the Pilot Initiation

In order to evaluate whether the tick test or the bid test affects the level of stock prices, we examine average daily returns and average cumulative returns for pilot and control stocks over a 21-day period surrounding the beginning of the pilot. If pilot stocks are over-valued because of the price restrictions these returns should be significantly negative for pilot stocks relative to the control stocks on or around the first day of the pilot. Cumulative returns are normalized to zero on April 29, the trading day prior to the start of the pilot.

We believe it likely that any valuation effects of the pilot that are not already impounded into the price before the start of the pilot would most likely be observed immediately upon the initiation of the pilot, and reflected in the returns on the first day. However, we also consider the possibility that the effects of the pilot might be manifest over a longer time period. Therefore, we also examine returns over a six month time horizon. To avoid a survivor bias, we compound returns to the six month horizon if a stock falls out of the sample prior to October 31, 2005. In addition, to control for the systematic risk of a stock, we estimate an alpha for each stock. We estimate these alphas in-sample using the market model:

[48] It is worth noting that neither the bid test nor tick test applies to the trading of Nasdaq NM stocks on exchanges.

$$R_t = \alpha + \beta R_{Mt}$$

where R_t is the return on the stock in day t, and R_{Mt} is the equally-weighted market index return from CRSP for that day. We also estimate the tendency of the alphas to be significantly positive or negative. Pilot stocks might be more likely to have negative alphas than control stocks if either price restrictions corrected over-pricing over long horizons or if price restrictions prevent constant short selling pressure from pushing prices below their equilibrium level. Pilot stocks might be less likely to have positive alphas if price restrictions facilitate over-pricing.

C. Measuring Large Price Reversals

As part of our analysis of whether price restrictions inhibit price patterns that may be indicative of short-term price manipulation, we wish to examine the frequency of large short-term price movements that are immediately reversed. Although such price reversals, or "spikes," are bound to occur with some frequency due to the natural variation of prices, they may also be a sign of price manipulation. If the price patterns indicative of manipulation are more prevalent on the short side than on the long side, we would expect to see more negative price spikes than positive ones. And if price restrictions are effective at reducing the potential for price manipulation, we might expect to see significantly more price spikes for pilot stocks than control stocks.

To investigate this, we define the following measures of short-term price reversals:

$$Negative: \min(-R_{t-1}, R_t^L) / \sigma_i$$
$$Positive: \min(-R_t^L, R_{t-1}) / \sigma_i$$

In these formulas, σ_i represents the holding period (non-annualized) standard deviation of returns on stock *i,* measured using data in the Pre-Pilot Period, R_t is the simple one-period return

on stock *i* at time *t*, and R_t^L is the one-period return measured as a percentage of the lagged stock price:

$$R_t = \frac{P_t - P_{t-1}}{P_{t-1}} \qquad R_t^L = \frac{P_t - P_{t-1}}{P_{t-2}},$$

where P_t represents the price of stock *i* at time *t*. We estimate these metrics using 5-minute and 30-minute horizons. The return as a percentage of the lagged price is used in the measure so that the adjacent returns will be compared on the same basis.[49]

We normalize the reversal measure by the standard deviation of returns on the same stock, computed using the same return interval over which the reversals are measured, in order to ensure that the measure will capture reversals that are large in magnitude compared to the typical movement on the stock. The standard deviation is computed using only pre-pilot returns data, so that the measure will not be affected by any changes in volatility that may be related to the pilot.

By definition, a "negative reversal" only occurs in periods when there is a negative return followed by a positive return—otherwise, the negative reversal measure is equal to zero. If a stock experienced a negative return of 3 standard deviations that was fully reversed in the next period, our negative reversal measure would be 3. If a return is only partially reversed, only the portion that is reversed is counted in the measure.

We do not test whether this measure changes across Pre-Pilot and Pilot Periods because the Pre-Pilot Period is already used to normalize the measure. Rather, we focus on differences between the control and pilot samples during the Pilot Period. In order to test whether the frequency of extreme reversals differs across the two samples, we use a nonparametric bootstrapping methodology that does not require any assumptions about the probability

[49] For example, if a stock price increases from 40 to 50 and then returns back to 40, this corresponds to a 25% return followed by a -20% return. In our measure, we would compute the negative return as a percentage of the original price, which would make it a -25% return.

distribution of returns or return reversals. Essentially, this method estimates the likelihood of observing a particular number of reversals under the null hypothesis that the distribution of reversals in the pilot sample is the same as the distribution in the control sample. This is implemented as follows. For a given "threshold" level of the reversals measure, we count the number of reversals in the pilot sample that exceed that threshold. We then select from the control sample (with replacement) a random sample of reversals equal in size to the pilot sample. Within this randomized sample, we count the number of reversals exceeding the threshold, and observe whether the number is higher or lower than the number observed in the pilot sample. We repeat the process 1,000 times and observe the frequency with which the number of reversals in the randomized control sample equals or exceeds the number in the pilot sample. We report the significance based on a two-tailed test—for example, the number of reversals in the pilot sample would be deemed significant at the five percent level if a number that high occurs 2.5% of the time or less in randomized control samples.

D. Autoregression Methodology for Measuring Reversals

As an alternative approach to measuring the impact of the pilot on price reversals, we employ a new methodology. Similar in spirit to autoregression, this methodology involves measuring the extent to which positive and negative price movements reverse in subsequent periods. Specifically, we use intraday returns to estimate a model of the form:

$$R_t = \sum_{n=1}^{5} \alpha_n R_{t-n}^{-} + \sum_{n=1}^{5} \beta_n R_{t-n}^{+} \; .$$

In this equation, R_t represents the stock return in period t, and the regressors are the positive and negative components of lagged returns:

$$R_t^{-} = \min(0, R_t) \qquad\qquad R_t^{+} = \max(0, R_t) \; .$$

The estimated α and β coefficients measure the extent to which positive and negative returns tend to reverse or continue in subsequent periods. In a world where stock prices follow a random walk, the true coefficients would be equal to zero. Unlike an ordinary autoregression, this specification permits the degree of momentum or reversals to differ for positive and negative shocks. In either case, positive coefficients would indicate that returns exhibit short-term momentum, while a negative coefficient would indicate short-term reversals. For example, if the coefficients α_1 and α_2 were estimated to be -0.05 and -0.01, this would mean that a negative return of one percent would, on average, be followed by a positive return of five basis points in the next period, and a positive return of one basis point in the period after that. If the coefficients β_1 and β_2 were estimated to be -0.04 and -0.02, this would indicate that a positive return of one percent would on average be followed by negative returns of four and then two basis points in the next two periods. We are interested in comparing these coefficients for pilot and control stocks. If price restrictions help prevent short-term negative stock price manipulations, we would expect to see the α coefficients higher for pilot stocks than for control stocks.

E. Small and Low-Volume Stocks

One policy alternative outlined in the first Pilot Order was to extend a uniform test to all securities, including securities with a lower market capitalization or less actively traded than those included in the Pilot. While our analysis cannot directly investigate the effects of price restrictions for stocks beyond the range covered by the pilot sample, it can provide relevant evidence by investigating whether the impact of the Pilot has been substantially different for the smaller stocks than for the larger stocks in the Pilot, or whether the impact has differed for

actively traded and less actively traded issues. To examine these questions, we run a series of regression-based tests of the following form:

$$\text{Market Quality}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i + \beta_{11} \text{Pre Market Quality}_i$$

where "Market Quality" represents a characteristic of interest such as spreads, depth, or volatility. The "Decile" variables are indicator variables corresponding to each of the nine lowest deciles, for two different decile partitions. The first partition ranks stocks by market capitalization on April 28, 2005. The second partition ranks stocks by annualized turnover in the Pre-Pilot Period as measured by its average daily share volume divided by its shares outstanding as of April 28, 2005 and multiplied by 250. In each case, the decile indicators take on a value of one if the stock falls within the designated decile, and zero otherwise. These partitions allow us to test whether the price restrictions have a larger impact on certain categories of stocks. In particular, we examine each $\beta_{10} + \beta_k$ to measure whether the pilot has a significant effect on stocks in decile *k*.

VI Results and Analysis

A. The Nature of Short Selling

1. Short Selling Activity

Price restrictions may impose costs on short sellers in the form of lower fill rates and delays on execution. If these costs are economically significant, then we would expect the removal of the price restrictions to result in increased short selling. We would expect short selling to increase more for pilot stocks than control stocks if the price restrictions are costly, or be the same for the pilot and control stocks if price restrictions are not costly.

Table 3 shows how removing the price restrictions affects the level of short selling, based on three different measures, including (i) the number of shares sold short on a given day divided by the total share volume, (ii) the number of trades involving short sales, and (iii) short interest.[50] Panel A shows the Pre-Pilot Period to Pilot Period comparison while Panel B reports the average coefficients from regression analysis. In the Listed market, short volume increases significantly from 24.4% to 26.3% of total volume in the pilot sample, while the change is not statistically significant for the control sample. A comparison of these two changes reveals that short selling volume increases by about 2% of total volume as a result of removing the tick test, suggesting that the tick test imposes economic costs on short sellers. The same conclusion can be drawn from the statistics on short selling as a percentage of trades.

Similarly, both volume and trade measures for Nasdaq NM Stocks suggest that the application of the bid test reduces short selling. The regression analysis in Panel B confirms these conclusions and also shows that the effect of the tick test is stronger than the effect of the bid test.

Although our results indicate that price restrictions appear to constrain the volume and frequency of short sales, these effects are not reflected in short interest. As indicated in Table 3, both pilot and control stocks exhibited significant increases in short interest around the time of the Pilot Period. However, none of the tests indicate any significant difference between pilot and control stocks. Both the univariate results in Panel A and the regression-based results in Panel B lead to the same conclusion: price restrictions appear to have no effect on short interest for Listed

[50] Though not reported, OEA found that pilot stocks were less likely to qualify for the Regulation SHO threshold list than control stocks. This result rejects the conjecture that removing price tests leads to more settlement failures. In order to maintain a focus on the price tests, analysis of the Regulation SHO threshold list is not included in this report.

Stocks or for Nasdaq NM Stocks. The same result is observed whether short interest is measured in percentage of shares outstanding or in "days to cover."

The fact that we document statistically significant increases in short selling volume but not in short interest can be interpreted in various ways. One interpretation is that the increase in short volume is due primarily to increased short selling by parties that close out their short positions within the day—or, more generally, that the increase in short volume was accompanied by a decrease in the average horizon over which short positions are held. We should also note that the absence of a statistically significant result does not imply that no change occurred. Given that we observe short interest only monthly, it is possible that our statistical test did not have sufficient power to detect a change in short interest.

Because short sales in Nasdaq NM Stocks executed outside of the Nasdaq market are not subject to the bid test, short sellers can avoid the bid test by sending orders to markets other than Nasdaq. The removal of the bid test might result in an increase in short sales on Nasdaq in Nasdaq NM Stocks because the order routing decision might no longer be affected by the application of the bid test. The Nasdaq market share statistics in Panel A of Table 3 show that Nasdaq's market share in short sales increased 3.9% in pilot stocks and by 1.3% in non-pilot stocks. The difference of 2.6% is statistically significant, which is consistent with the non-uniform application of the bid test altering order routing decisions.

2. Option Activity

If price restrictions drive short sellers to trade options in lieu of stocks, then their removal should decrease option activity. Table 4 summarizes the changes in option trading for pilot and control stocks between the Pre-Pilot Period and Pilot Period. There are a total of 628 pilot and

1,263 control stocks that had listed options included in the analysis. Put and call option trading volume is aggregated over all classes and markets for each underlying stock on a daily basis. Then, the put and call option trading volume is averaged across days for each stock for period before the pilot and for the period of the pilot. The change in put option trading volume is calculated as the average daily put (call) volume during the pilot minus the average daily put (call) volume before the pilot. Finally, the change is averaged across stocks to yield the results reported in Table 4. Averaging across stocks allows us to maintain the independence of the observations and perform a t-test comparing the mean of the pilot stocks to the mean of the control stocks. The results for open interest and signed option volume use the same methodology.

If the price restriction drives would-be stock short sellers to trade options to implement their investment strategies, then the lifting of the price restrictions on the pilot stocks would lead to a significant decline in option trading for pilot stocks relative to the control stocks. As indicated in table 4, between the Pre-Pilot Period and Pilot Period, we do observe a slight increase in average trading volume for calls and puts on Listed Stocks, a decrease in average trading volume of calls and puts on Nasdaq NM Stocks, and an increase the average open interest of all categories. Based on the paired *t* test, however, we find no statistically significant changes at the 5% confidence level. We also observe that open interest increased less on average for control stocks than for pilot stocks, but again, based on the two-sample *t* test, we find no statistically significant differences between the changes in the pilot and control samples.

As an additional measure, we examine signed option volume. This is computed by subtracting the change in the put volume from the change in the call volume. A positive signed option volume suggests either an increase in long side buyer speculation or a decrease in short

side seller speculation. A negative signed option volume suggests either a decrease in long side buyer speculation or an increase in short side seller speculation. For example, if the change in the call volume is -10 and the change in the put volume is -5, then the signed option volume equals -5. On the other hand, if the change in the call volume is -5 and the change in the put volume is -10, then the signed option volume is 5. Again, we find no significant difference between pilot and control stocks.

Since short sellers may use short-term options in lieu of equity short sales, Table 4, Panel B shows the results for short-term options only.[51] The results are quantitatively similar to the results in Table 4, Panel A. Thus, the conclusions drawn from Table 4, Panel A hold for short-term options.

Overall, the options market results provide no statistical evidence supporting the hypothesis that the tick test drives would-be short sellers away from the equity markets and to the options markets to trade.[52] Option trading volume of pilot Nasdaq NM Stocks show a decline in option volume relative to control stocks of 15%, but this difference is not statistically significant.

3. Mechanical Effects

Price restrictions have the mechanical effect of forcing short sellers to be liquidity suppliers instead of liquidity demanders because short sales can rarely be executed against the bid price. Therefore, we expect the removal of price restrictions to be associated with changes in quoting and trading purely because of the mechanics of the rules. In particular, Table 2 shows

[51] Long and short-term options are identified using the Options Clearing Corporation directory as of October 31, 2005.
[52] A regression model that controlled for changes in volatility in the pre- and post-periods provided results that were consistent with those in Table 4.

that about 46% of trades occur on downticks when the tick test applies. We expect that the removal of the tick test will lead to more balanced trading around 50% downticks because short sales can now execute on downticks. This effect should be more obvious in Listed Stocks than Nasdaq NM Stocks where the trades occur on downticks half the time even with the bid test.

A second potential mechanical effect is the percentage of time during the day when the most recent bid change was downward. Table 2 shows that this figure is around 39% when the tick test applies and 47% when the bid test applies. Removing either price restriction could increase the percentage of the day with down bids because short sales can more easily hit the bid to force more downbids. Conversely, if the different price restrictions can explain some of the divergence in these figures, we expect the percentage of downbids in Listed Stocks and Nasdaq NM Stocks to converge.

Table 5 shows how the tick and bid tests affect trading and quoting mechanics. The downtick rows in Panel A show that the percentage of trades on downticks increases from 46% to almost 50% in pilot Listed Stocks. Conversely, the percentage of trades on downticks in control Listed Stocks goes down. On net, the percentage of trades on downticks is fairly balanced when the tick test does not apply and is skewed toward upticks when the tick test does apply. Nasdaq NM Stocks appear to have much more balanced trading even with the bid test so that removing the bid test results smaller increase in the number of downticks. Panel B confirms the result that the tick test has a much larger effect on trading mechanics than the bid test.

The downbid rows in Table 5 measure the percentage of the trading day during which the most recent bid change was downward. Pilot Listed Stocks experience a small increase in the prevalence of downbids but this increase is roughly similar to an increase experienced by control Listed Stocks. The results show a decline in the prevalence of downbids for pilot Nasdaq NM

Stocks, suggesting that short selling under the bid test might shorten the duration of upbids, reflecting the restriction that short sales can only hit upbids.

B. Market Quality

1. Liquidity Measures

Because price restrictions alter how orders transact with each other, they have the potential to alter traditional measures of liquidity. In particular, the price restrictions will often keep a short sale from executing against the bid quote. Therefore, we expect the depth at the bid quote to be lower without price restrictions. If a short sale can not execute against the bid, it often adds depth to the ask quote, and hence, the depth of the ask might be lower without price restrictions. Alternatively, a restricted short sale might set a lower ask price and an unrestricted short sale might exhaust the depth at the bid resulting in a lower bid price. Either way, short sale price restrictions can result in a narrower quoted bid-ask spread.

While quoted spreads and depths measure the displayed supply of liquidity, the effective spread measures liquidity actually available to investors. Therefore, an examination of effective spreads is necessary to understand the effect of price restrictions on liquidity. Because price restrictions can affect the displayed liquidity, we might also expect them to affect the actual liquidity as well.

Table 6 shows results on the effect of price restrictions on liquidity. For the pilot sample, the ask depth decreases for Listed Stocks but increases for Nasdaq NM Stocks. The control sample experiences an increase in depth at the ask. Comparing the changes reveals that the ask depth of the pilot stocks decreased relative to the ask depth for the control stocks in both Listed and Nasdaq NM Stocks. This change is significant for Listed Stocks in both the univariate and

regression-based tests, but is significant for Nasdaq NM Stocks only in the regression-based tests in Panel B. Panel B also shows that the ask depth is augmented about three round lots more when a tick test applies than when a bid test applies.

The bid depth results in Table 6 are slightly different than the ask depth results. The bid depth increases for all sub-samples, but the difference between the pilot and control samples is not significant in Panel A, while Panel B suggests that the bid depth of the pilot stocks does not increase as much as the bid depth of the control stocks. This effect is larger for Nasdaq NM Stocks than for Listed Stocks, therefore, the bid test seems to augment the bid depth more than the tick test does by about one round lot.

We examine two measures of quoted spread. The first, known as the "absolute spread," is simply the difference between the ask price and the bid price, measured in pennies. The second, called the "relative spread," is the absolute spread divided by the bid-ask midpoint, thus measuring the displayed cost to trade as a percentage of the stock's value. Panel A shows that the quoted spreads did not change much when the pilot started for either the pilot stocks or the control stocks. Only the relative quoted spread in control stocks saw an increase but that increase was not statistically different from the change in relative spreads experienced by the pilot stocks. The conclusions from Panel B give a more mixed picture. Quoted spreads decline about 0.3 cents more for pilot stocks, a result that is the same for Listed Stocks and Nasdaq NM Stocks. This result suggests that the tick and bid tests appear to reduce liquidity. However, the results on relative quoted spreads yield the opposite conclusion. While these results are statistically significant, the point estimates are fairly small. The quoted spreads decline by less than half a penny and the relative quoted spread increases by less than a basis point. Taken

together, these results suggest that the tick and bid tests have a slight effect on quoted spreads, if any.

In addition to quoted spreads we also examine effective spreads, estimated for each trade by computing the absolute value of the difference between execution price and the current bid-ask quote midpoint. As we did for the quoted spread, we estimate both absolute and relative effective spreads. The effective spread results in Panel A of Table 6 look quite similar to the quoted spread results. Only one of the changes is statistically significant, a decline in the effective spread of pilot Nasdaq NM Stocks. This result alone would suggest that the application of the bid test decreases liquidity. However, this conclusion is weakened by the lack of statistical significance in the other sub-samples and the lack of a difference between the pilot and control stocks. The Panel B results suggest that the tick test has no impact on effective spreads, but the results on the bid test are mixed. The bid test appears to decrease effective spreads and increase relative effective spreads. Like the results on quoted spreads, the magnitudes of these changes are small.

Overall, the Regulation SHO Pilot shows us that the price restrictions appear to augment depth at both the ask price and the bid price, but price restrictions have little if any effect on realized liquidity. These results are fairly consistent whether the price restriction is structured as a tick test or as a bid test, although the tick test augments the ask depth more and the bid test augments the bid depth more.

2. Return Volatility

The next set of tests examine whether removing the price restrictions alters return volatility. Table 7 displays test results for several volatility measures and several return horizons

to capture different aspects of volatility. The daily price range measures the degree to which prices fluctuate within a day by comparing the high price to the low price in a day. The daily price range declines from the Pre-Pilot Period to the Pilot Period for each subsample. This decline is statistically significant for both Listed and Nasdaq control samples and for the Nasdaq pilot sample, but not for the Listed pilot sample. Panel A suggests that the decline was statistically similar for pilot and control stocks, while the Panel B regression suggests that the daily price range increased for pilot stocks relative to control stocks for both the Listed and Nasdaq samples. Taken together, the daily price range results are mixed on whether the tick and bid tests dampen volatility.

To explore intraday volatility further, we examine our next two volatility measures, absolute returns and return variance, over three time horizons, 5 minutes, 30 minutes, and one day.[53] These measures would increase for pilot stocks over the shorter horizons if the tick and bid tests dampen transitory volatility. The measures would increase for the pilot stocks over the longer horizons if the tick and bid tests dampen permanent volatility. Economically, transitory volatility captures the efficiency of the trading mechanism while permanent volatility captures the effects on equilibrium prices. We separately analyze absolute returns and return variance because each measures volatility slightly differently. Return variance has a tendency to put more weight on larger price movements than absolute returns.

The average absolute returns are lower during the Pilot Period for the control sample across all three return horizons. The univariate results in Panel A show that the pilot stocks experienced a statistically similar decline in the absolute returns as the control stocks for the 30 minute and daily horizons. At the five-minute horizon, however, the pilot sample experienced an

[53] The 5 and 30 minute absolute returns and variances are estimated without including the first half hour of the trading day, after hours trading, or pre-open trading.

increase in absolute returns relative to the control stocks for both Listed and Nasdaq NM Stocks. The regression results in Panel B confirm this finding and show that the effect is larger for Listed Stocks. Panel B also confirms the results for the daily horizon but indicates that absolute returns increased over the 30-minute horizon for pilot stocks relative to control stocks. While the 30-minute results are mixed, the absolute return results suggest that the tick and bid tests have no effect on the magnitude of daily returns while they seem to dampen the magnitude of five minute returns. Further, the tick test seems to dampen short-term returns more than the bid test.

The return variance results in Panels A and B are quite a bit weaker. Panel A shows that the changes to return variances experienced by pilot stocks are statistically similar to the changes in return variances experienced by control stocks for both Listed Stocks and Nasdaq NM Stocks, and this result holds for all three return horizons. Panel B confirms this result for the 30 minute and daily return horizons but finds that pilot Listed Stocks seem to experience an increase in return volatility over the 5 minute horizon relative to control Listed Stocks. In summary, the bid test seems to have no effect on return variance over any time horizon while the tick test might dampen return variance over the five minute horizon.

Because the results above suggest that price restrictions may dampen transitory volatility, we next focus on variance ratios that are specifically designed to capture transitory volatility by comparing the short horizon volatility to longer horizon volatility. If no transitory volatility exists, variance ratios are designed to equal one. We examine three different variance ratios. We compare five minute variance to thirty minute variance, five minute variance to daily variance, and thirty minute variance to daily variance. Panels A and B show that the variance ratio of five to thirty minute returns increased for pilot Listed Stocks relative to control Listed Stocks. Further, Panel B shows that the change for Listed Stocks differs significantly from that

SEC_OEA_FCIC_001321

of Nasdaq NM Stocks. However, none of the other variance ratios changed significantly. Because the variance ratios relative to the daily level did not show any changes, the results on transitory volatility are somewhat weak. However, the result for Listed Stocks over the five minute horizon to thirty minute horizon still helps solidify the conclusion that the tick test dampens transitory volatility over the five-minute horizon but seems to have no effect on permanent volatility.

C. Effect on Stock Prices

As outlined in section III above, numerous theoretical models suggest that short selling constraints can affect equilibrium stock prices. Some of these models predict that stocks are likely to be more overpriced when short selling constraints are more binding, and when investors disagree more about the stock's true value.

Our evidence above suggests that price restrictions do constrain short selling somewhat. Thus, we are interested in testing the hypothesis suggested by these theories, that removing price restrictions will lessen overpricing. This hypothesis is not likely to hold unless the price restrictions are significant relative to other short selling constraints and our sample stocks are overpriced prior to the start of the pilot. Therefore, rejecting the hypothesis might mean that price restrictions are minor relative to other short selling constraints or that our sample stocks were not overpriced.

Table 8 reports average daily returns and average cumulative returns for pilot and control stocks in the period surrounding the beginning of the pilot. If pilot stocks are over-valued because of the price restrictions, these returns should be significantly negative for pilot stocks relative to the control stocks. Cumulative returns are normalized to zero on April 29, the trading

day prior to the start of the pilot. As indicated in Panel A of Table 8, we observe for Listed Stocks a statistically significant difference between the average returns of control and pilot stocks on May 2, the first day of the pilot. The average control stock experienced a return that exceeded the average pilot stock by about twenty-four basis points. However, we do not observe significant differences in returns on other days after the start of the pilot, nor are the cumulative returns statistically distinguishable at horizons beyond the first day. For Nasdaq NM Stocks, we observe no differences in daily or cumulative returns at or after the start of the pilot that are statistically significant at the five percent confidence level.[54] Because the Listed difference does not persist and because of a lack of a difference in Nasdaq NM Stocks, neither the tick nor the bid test appear to cause stocks to be over-valued.

Figure 1 displays the returns for the pilot and control samples over the first six months of the pilot. The figure gives the raw returns as well as the market adjusted returns. Returns in general appear to be positive over this period but are close to zero when subtracting the market return. Further, the pilot sample appears to under-perform the control sample, especially for Listed Stocks. Table 9 confirms that the six month returns of the pilot stocks appears lower than that of the control stocks. However, this result is not statistically significant. Therefore, the six month returns for the pilot sample are statistically similar to the six month returns for the control sample.

Table 9 also shows that the average alphas are negative but very close to zero. This means that when controlling for risk, the returns of the sample stock are about the same as the returns of the market portfolio. Further, the univariate results of Panel A and the regression

[54] On the Nasdaq NM side, we do observe a statistically significant difference on a single day several days prior to the start of the pilot (April 26). In Table 8, we tested for statistical significance on 21 separate days in two different markets, for a total of 42 different hypothesis tests. Under the hypothesis that the pilot has no effect, we would expect random errors to cause roughly two out of the 42 tests to show false positive significance at the five percent level.

results of Panel B show that the alphas of the pilot sample are statistically similar to the alphas of the control sample. Therefore, the pilot stocks did not underperform the control stocks. This suggests that the removal of the price restrictions will not result in either a long horizon correction of over-pricing nor is it likely to lead to prices being driven below their equilibrium value.

Table 9 also shows the tendency of the alphas to be significantly positive or significantly negative. An alpha is deemed to be negative if the estimate is significantly negative at the 5% level in a two-tailed test. Similarly, an alpha is considered to be positive if the estimate is significantly positive at the 5% level in a two-tailed test. If the alphas are completely random, we would expect to find 2.5% of them positive and 2.5% of them negative. Table 9 shows that the frequency of positive alphas is less than 2.5% while the frequency of negative alphas is slightly higher.[55] The frequency of negative alphas is statistically similar for pilot stocks and control stocks, providing further evidence against prices being driven below their equilibrium level. Among Listed Stocks, the control stocks appear to be more likely to have positive alphas, potentially because price restrictions facilitate over-pricing. This finding however, is weakened by the observation that fewer than 2.5% of control stocks have significantly positive alphas.

D. Market Manipulation

The type of analysis conducted in this study cannot directly prove whether market participants are engaging in manipulative practices, because it is inherently difficult to measure whether the Pilot has had any impact on the degree to which markets are susceptible to

[55] We also estimated the alphas using the value-weighted index. About 2.5% or fewer alphas were significantly positive and about 2.5% or fewer were significantly negative.

manipulation. Our approach is to identify certain data patterns that we would expect to be more prevalent in a world where prices are manipulated, and investigate to see if these price patterns are more common for pilot stocks than control stocks. Such a pattern does not necessarily mean that manipulation has occurred, but indicates that we might have cause for further analysis.

As argued above in section I-B, if price restrictions inhibit manipulation by short sellers and/or facilitate upward manipulation, we might expect to see more large, sudden price declines in pilot stocks than control stocks. Further, we might expect fewer large, sudden price increases in pilot stocks than control stocks. Either effect should be reflected in the form of decreased skewness in the short-term returns distribution.

Table 10 reports results of statistical tests based on 5-minute, 30-minute, and 1-day returns. For each returns horizon, we follow the same approach as before and test for changes in skewness between the Pre-Pilot Period and Pilot Period, separately for pilot and control stocks, and for Listed and Nadaq stocks, and then test whether the difference of differences is significantly different from zero.

As the table indicates, we find no significant changes between the Pre-Pilot Period and Pilot Period, with the single exception that there appears to have been a marginally significant increase in the skewness of Nasdaq NM control stocks at the 30-minute return interval. However, neither in this nor any other case do we find any statistically significant differences between pilot and control stocks. Thus, we find no evidence that the pilot program has had any impact on returns skewness. The 5-minute and 30-minute results reported in Table 10 are based on the skewness of returns computed using quote midpoints.[56]

[56] We also performed the test using returns computed using trades (results not reported) and again found no significant differences between pilot and control stocks.

Our second approach to testing whether eliminating price restrictions may lead to an increase in price patterns indicative of market manipulation involving short sales is to examine the relative frequency of large negative and positive price reversals, as explained in section V-C, above. Our results are presented in Table 11. Panel A reports results for return reversals occurring over subsequent 5-minute intervals, and Panel B reports results based on 30-minute intervals.

In this table, the line corresponding to "Reversal Size > 2" reports the number of times (per 100,000 observations) that a stock price move of 2 standard deviations or more was reversed in the subsequent period. So, for example, the number 338.4 in the first column of Panel A indicates that for Listed, pilot stocks, the frequency of negative five-minute reversals greater than two standard deviations in magnitude is approximately 0.003384, or 338.4 out of 100,000. In this table, statistical significance is ascertained using a nonparametric bootstrapping procedure outlined in section V-C. This test indicates whether the observed frequency of reversals would constitute a rare event under the null hypothesis that the distribution of reversals is the same for control and pilot stocks. Results are reported for thresholds ranging from two to nine standard deviations.

Our results in Panel A indicate that the pilot stocks tend to experience significantly more 5-minute return reversals than the control stocks, at least for thresholds in the range of two to four standard deviations. This same result is observed for Listed Stocks and Nasdaq NM Stocks. If price restrictions deter price patterns consistent with downward manipulations but not upward manipulations, we might expect to see more negative price reversals in the pilot sample than the control sample, but no difference in positive reversals. In our sample, however, the effect of the

pilot appears to be equally as strong, if not stronger, for positive reversals than for negative reversals.

The results based on the 30-minute horizon, reported in Panel B, tell a different story. At the 30-minute horizon, there is no longer any statistical evidence that pilot stocks have a higher frequency of reversals than control stocks.[57]

As explained in Section V-D, above, our third approach to investigating whether removing price restrictions increases the prevalence of price patterns consistent with market manipulation is to use an autoregression model to estimate the extent to which positive and negative returns tend to be reversed in subsequent periods. The results of this analysis are presented in Table 12.

Panel A shows how five minute returns are correlated with the returns of each of five previous five-minute periods. A positive number reflects returns in the same direction. A negative number reflects return reversals. Most of the coefficients in Table 12 are negative, reflecting a tendency for five-minute price changes to be reversed over subsequent periods. While many of the autocorrelations changed from the Pre-Pilot to Pilot Period, we focus on how the pilot sample compares to the control sample. Over one lag, removing price restrictions makes returns in Listed Stocks more negatively autocorrelated. This is true whether the previous returns were positive or negative. The effect continues for two lags (ten minutes), but only following positive returns. Price restrictions have no effect on five-minute return autocorrelation in Nasdaq NM Stocks.

[57] Panel B of Table 11 reports results for 32 different hypothesis tests (eight different thresholds, positive and negative reversals, Listed and Nadaq samples). Of these 32 tests, only one indicates statistical significance at the five percent level (negative reversals for Listed Stocks at the 3-standard deviation threshold). Even under the null hypothesis of no true effect, we would expect any individual test to show a "false positive" at the 5% significance level approximately 5% of the time. Thus, one significant test statistic out of 32 tests does not constitute a meaningful rejection of the null hypothesis.

Panel B shows the results for thirty minute returns. Measured relative to control stocks, the pilot stocks experience no statistically significant increase in return correlation for any of the thirty minute intervals examined.

In summary, returns in Listed Stocks are negatively serially correlated following both positive and negative returns over short horizons and removing price restrictions increases this negative correlation. The symmetry of these results is consistent with the volatility results above. We find no statistically significant impact for Nasdaq NM Stocks.

E. Small and Low-Volume Stocks

The analysis presented heretofore analyzes Listed Stocks and Nasdaq NM Stocks separately, but beyond this does not make any effort to ascertain whether the pilot may have a disproportionate or qualitatively different effect on smaller or less liquid stocks. In order to address these questions, we partition the sample into deciles according to market capitalization and turnover. As described above in section V-E, we partition the sample into deciles before separating them across markets, to ensure that Listed Stocks and Nasdaq NM Stocks in the same decile are comparable. The sample sizes resulting from these decile partitions are reported in Table 13. As the table indicates, the Listed Stocks are more concentrated in the higher deciles of market capitalization, while the opposite is true for Nasdaq NM Stocks. However, both Listed and Nasdaq NM Stocks have representation across all deciles of the two measures.

Tables 14 through 26 present our results analyzing how many of the results presented earlier vary as a function of size and liquidity. As explained in section V-E, above, these tables are based on a regression analysis where each model includes a pilot indicator and a pilot indicator interacted with indicator variables for deciles one through nine. In this model, the

marginal effect of the pilot is captured through two channels, first through the pilot indicator variable, and secondly through the interacted indicator variable. To facilitate interpretation, the tables report the sum of the coefficients on the pilot dummy and the interacted terms. This way, the entries in the table show directly how the pilot sample differs from the control sample within each decile.

Table 14 shows how the tick and bid tests affect short selling volume for stocks in each size and turnover decile. Removing the rules increases short selling volume in almost every size and volume decile. Further, the tick test appears to hinder short selling slightly more in small stocks than in large stocks. The bid test, on the other hand, appears to hinder short selling slightly more in large stocks than in small stocks. The affect of the tick and bid tests appear unrelated to turnover level. According to the Nasdaq market share results in Table 15, the removal of the bid test on Nasdaq seems to increase Nasdaq's market share more for small stocks than for large stocks. Overall, the tick and bid tests do seem to have differing affects on short selling for stocks of varying sizes.

In results not reported in tables, only the tick test has a differential effect on the balance of trading in stocks of differing sizes while all other mechanical effects are similar across size and activity levels. The tick test has a bigger effect on the symmetry of trading in smaller stocks but a constant effect on the symmetry of trading in stocks of varying activity levels.

Tables 16 and 17 show whether the augmentation of the bid and ask depth is similar for large and small stocks. These patterns are qualitatively similar in both tables. The tick test augments depth across almost all size and activity levels without clearly augmenting large or small stocks more. The bid test's influence on depth, however, varies widely across size and

activity levels without a discernable pattern. Therefore, the depth augmentation from the tick and bid tests appears unrelated to the size or activity level of the stocks.

As stated above, the increase in the depth at the inside quote affects the displayed supply of liquidity but might not influence realized liquidity, as measured by effective spreads. Table 18 shows that the tick test has no effect on effective spreads for almost all size and activity levels. The bid test, however, seems to result in lower effective spreads for large or more active stocks and potentially higher spreads for small or less active stocks. When significant, however, the magnitudes are still only a few basis points.

The results above show that transitory volatility is dampened by the tick test with much weaker evidence on the bid test. Table 19 shows that the tick test primarily dampens the volatility of small stocks but seems to amplify the volatility of large stocks. The bid test shows a similar pattern but to a lesser degree. The results across turnover levels are not as striking. The tick test seems to dampen volatility for most activity levels and the bid test shows similar yet substantially weaker evidence.

Table 20 summarizes the evidence on how the tick and bid tests affect longer-term variance. While the tick test does not affect the daily return variance in stocks as a whole, it does seem to dampen daily return variance in small stocks and increase daily return variance in large stocks. The bid test shows a similar pattern but the effect is only significant for a few of the smaller size levels. The tick and bid tests have no effect on daily return variance for any activity level.

The results above show little evidence that the tick or bid tests affect price levels. However, there is a 24 basis point return difference between pilot and control Listed Stocks on the first day of the Pilot. Table 21 summarizes whether this return difference varies by size or

activity level. The evidence shows that for most size and activity levels, the pilot and control stocks experienced a statistically similar return on the first day of the Pilot. The Listed pilot stocks had a lower return than the control stocks in the largest size group while the Nasdaq NM pilot stocks had a lower return than the control stocks in the highest turnover group. Hence, the prior results seem to be driven by the large Listed Stocks.

Table 22 compares the pilot stock six-month alphas to the control stock six-month alphas for the various size and activity groups. Like the May 2 results, the pilot alphas are statistically similar to the control alphas in every size and activity level. Therefore, the tick and bid tests do not promote or hinder pricing efficiency for any size or activity level.

Recall from Table 11 that negative and positive five-minute price reversals are more prevalent in the pilot sample than the control sample, especially for Listed Stocks. Repeating our analysis across deciles, we find the difference between pilot and control Listed Stocks is significantly more pronounced for stocks with the lowest market capitalization (results not presented). These findings are consistent with our other results indicating that smaller stocks tend to be more volatile when the tick test is removed. However, for the smallest Listed Stocks, we observe a greater number of positive than negative price spikes, suggesting that removing the tick test does not make smaller stocks unduly susceptible to negative price pressure.

VII Summary and Conclusions

The pilot program established by Regulation SHO exempted approximately one third of the Russell 3000 stocks from the "tick test" (Rule 10a-1) for Listed Stocks and the "bid test" (former NASD Rule 3350) for Nasdaq NM Stocks traded on Nasdaq or traded OTC and reported to an NASD facility. The pilot was designed to facilitate comparison between the pilot stocks

and control stocks, thus creating an unprecedented opportunity to observe in a controlled environment the effects of removing the price restrictions.

This study has compared pilot and control stocks along numerous dimensions, in an effort to capture a broad range of possible effects. Our main empirical results are as follows:

- The pilot is associated with increased short selling volume in Listed and Nasdaq NM Stocks, but appears to have no impact on the level of short interest in either market. The increase in short selling is slightly higher for small Listed Stocks than for large Listed Stocks.

- The pilot is associated with an increase in Nasdaq's share of trading volume in Nasdaq NM Stocks, suggesting that market participants are routing trades to other venues in order to avoid the bid test. The market share increases more for smaller stocks. For the largest Nasdaq NM Stocks, such as those included in the Nasdaq 100, there is no significant difference in market share.

- We find no evidence that the pilot has had any impact on the level of trading activity in the options market, as we would have expected to see if market participants are using option markets to avoid the tick test or the bid test.

- For Listed Stocks, less than 46% of all trades are executed on down bids when the tick test applies, while the number is close to 50% for pilot stocks, suggesting that Rule 10a-1 constrains the execution price in four to five percent of trades. For Nasdaq NM Stocks, Rule 3350 does not explicitly prevent trading on downticks, but our results show that it effectively constrains trading on downticks for about one half of one percent of trades.

- The pilot is associated with a decrease in quote depth, especially on the ask side for Listed Stocks—our evidence confirms that Rule 10a-1 forces some short sellers who would otherwise be liquidity demanders to act as liquidity suppliers. The decrease in depth appears unassociated with size or turnover.

- Other than the effect on market depth, the pilot has had no clear effect on market liquidity—most of our tests indicate that liquidity was not significantly impacted by the pilot, but some tests indicate small increases or decreases in liquidity, depending on the measure.

- The pilot is associated with an increase in some measures of intraday volatility. These increases appear to be confined to the smaller stocks as larger stocks experienced a decline in volatility during the pilot.

- On average across all types of stocks, the pilot does not appear to have any significant effect on daily volatility—however, our results indicate the pilot is associated with

lower volatility for stocks with higher market capitalization, and higher volatility for stocks with lower market capitalization.

- Based on the price reaction to the initiation of the pilot, we find limited evidence that the tick test distorts stock prices—on the day the pilot went into effect, Listed Stocks in the pilot sample underperformed Listed Stocks in the control sample by approximately 24 basis points. However, the pilot and control stocks had similar returns over the first six months of the pilot.

- We find no evidence of "bear raids" associated with the pilot. More specifically, we test for evidence of bear raids in three ways:

    - We test whether the pilot has affected the relative frequency of large negative vs. large positive stock returns, as reflected in the skewness of the returns distribution. There is no difference in skewness between control and pilot stocks
    - A bear raid may be associated with a large negative return that is very quickly reversed, or a "negative price spike." Although we do find a higher incidence of negative price spikes in the pilot sample at some horizons, the same thing is observed for positive price spikes.
    - We also measure directly the tendency for price movements to be reversed in subsequent periods. Again, we find that the pilot is associated with a slightly greater tendency for price changes to be reversed, but this effect is observed equally for positive and negative returns.

In summary, having examined the impact of the Regulation SHO Pilot on a wide array of market characteristics, we conclude that price restrictions constitute an economically relevant constraint on short selling. Our evidence suggests that removing price restrictions for the pilot stocks has had an effect on the mechanics of short selling, order routing decisions, displayed depth, and intraday volatility, but on balance has not had a deleterious impact on market quality or liquidity. In various dimensions, our evidence confirms that the tick test of Rule 10a-1 acts as a more binding constraint than the bid test of former NASD Rule 3350. On most dimensions, the effects of the pilot do not appear to be systematically related to market capitalization or trading volume, suggesting that our results give a reasonable picture of what we might expect to see if price restrictions were removed for all stocks, including smaller stocks and stocks less actively

traded than those in the Russell 3000. However, some results, particularly those involving volatility, suggest that the effect of the tick test and the bid test may be systematically related to market capitalization.

We conclude with a few caveats. While the Pilot study was designed to facilitate a natural experiment in a controlled environment, the results might not be entirely representative of removing the rule permanently for all stocks. It is possible that traders might behave differently if a rule were permanently and completely removed than if it is only temporarily or incompletely removed. Moreover, it is possible that traders with manipulative intentions might be on good behavior if they believe that heightened scrutiny during the Pilot increases their chances of getting caught.

Tables

Table 1: Sample characteristics

This table shows the number of sample stocks categorized by whether they are in the Pilot, their listing status, and whether they have tradable options on them. The Pilot stocks are those designated in the first Pilot Order that are trading on Amex, Nasdaq NM, or NYSE as of May 2, 2005. The Control stocks are the ones that were eligible to be selected for the Pilot but were not. The Control stocks are limited to those trading on Amex, Nasdaq NM, and NYSE as of May 2, 2005. Listed Stocks are stocks listed on NYSE or Amex. This table shows the sample sizes as of October 31, 2005 as well. To avoid survivor biases, we retain stocks in the sample even if they stocks cease trading on Amex, Nasdaq NM, or NYSE before the end of our sample period on October 31, 2005. This table shows the sample sizes as of October 31, 2005 as well. Stocks are considered optionable if they have traded options at some point in the four months prior to the start of the Pilot. Short-term options are options with experations within one year.,

Variable	Listed Stocks		Nasdaq Stocks	
	Pilot	Control	Pilot	Control
# Stocks (first day of the Pilot)	504	973	439	917
# Stocks (last day of the Sample Period)	496	949	423	877
# Optionable Stocks (all options)	350	690	278	573
	(69.44%)	(70.77%)	(63.33%)	(62.28%)
# Optionable Stocks (short-term options)	350	688	277	567
	(69.44%)	(70.56%)	(63.10%)	(61.63%)

Table 3: Changes in Short Selling Activity

This table summarizes how short selling changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" and the six months following the start date are called the "Pilot". The table shows the average change in short selling for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Short Volume is the number of shares in short sale transactions divided by total share volume. Short Trades is the number of short sale transactions divided by total transactions. Short Interest is the monthly short interest times 100 divided by the shares outstanding. Days to Cover is the monthly short interest divided by the average daily share volume during the corresponding month. Nasdaq market share is Nasdaq's share of the volume of short selling. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the Difference in the Change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 4: Changes in Option Trading

This table summarizes how option trading and open interest changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" and the six months following the start date are called the "Pilot". The table shows the average change in option trading and open interest for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Panel A reports statistics on all options. Panel B reports statistics on short-term options. The data includes securities that had put and call option volume in both the Pre-Pilot and Pilot periods. There were a total of 690 Control stocks and 350 Pilot stocks included in the Listed sample and 573 Control stocks and 278 Pilot stocks in the Nasdaq sample. Open interest and volume are adjusted for stock splits. New option listings after May 1, 2005 were excluded from the analysis. The data source for the options data is the Options Price Reporting Authority (OPRA). Short-term options are identified using the Options Clearing Corporation directory. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We also test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using two sample t-tests. [a, b] indicates that the difference for Nasdaq NM Stocks is statistically different from the difference for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 5: Changes in Trading and Quoting Mechanics

This table summarizes how trading and quoting mechanics change when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" Period. The table shows the average change in the number of down ticks and the percent of time on a down bid for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 7: Volatility

This table summarizes how volatility changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The table shows the average change in various volatility measures for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Daily Price Range is 100*(log high – log low). Absolute return and standard deviation are reported in percentage points. While standard deviation is reported, tests were run on variances to avoid Jensen's inequality. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for pilot securities and the variable's Pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 8: Returns around the May 2, 2005 Start of the Pilot

This table shows the returns surrounding the May 2 initiation of the pilot. The raw returns are equally-weighted averages of the returns for each stocks, as collected from CRSP. The Cumulative Returns are set to be zero on the day prior to the start of the pilot. The Cumulative returns represent the compounded returns on an investment made at the April 29 closing price. * indicates that the control stock returns are statistically different from the pilot stock returns at the 5% significance level in a two-tailed test. None of the returns are statistically different at the 1% level.

Table 9: Six Month Returns

The table summarizes tests of whether the six month returns of the pilot stocks differ from the six month returns of the control stocks. The raw returns are compounded cumulative returns from CRSP. If a stock is not in the sample for the entire six months, its return from its last day is compounded to six months. The market adjusted returns is simply the raw return minus the CRSP equally-weighted index. The alpha is estimated in-sample by regressing the raw return for a stock on the equally-weighted CRSP index return. A stock's alpha is considered "negative" if it is statistically below zero at the 5% level in a two-tailed test. Likewise, a stock's alpha is considered "positive" if it is statistically above zero at the 5% level in a two-tailed test. ** indicates that the control stock returns are statistically different from the pilot stock returns at the 5% significance level in a two-tailed test.

Panel A: Univariate Differences

Variable	Market	Pilot	Control	Difference
Raw Return	Listed	9.18%	11.56%	-2.38%
Raw Return	Nasdaq	14.21%	16.30%	-2.09%
Market Adjusted Return	Listed	-2.10%	-0.00%	-2.07%
Market Adjusted Return	Nasdaq	2.26%	4.01%	-1.74%
Alpha	Listed	-0.05%	-0.04%	-0.01%
Alpha	Nasdaq	-0.04%	-0.02%	-0.01%
Negative Alpha	Listed	5.56%	4.93%	0.60%
Negative Alpha	Nasdaq	2.73%	1.53%	1.20%
Positive Alpha	Listed	0.00%	0.92%	-0.92%**
Positive Alpha	Nasdaq	0.91%	1.20%	-0.29%

Panel B: Regression Tests

Market Model Alpha = $\alpha + \beta$Pilot

Variable	Market	Pilot	R-squared
Alpha	Listed	-0.0001	0.009
Alpha	Nasdaq	-0.0001	0.005

Table 10: Skewness

This table summarizes how skewness changes when the tick and bid tests are removed. The four months prior to the pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The table shows the average levels and changes in various skewness measures for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Sample skewness is computed for each stock in the pilot and contol sample in the Pre-Pilot and Pilot period, for five-minute, thirty-minute, and one day return intervals. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1% and 5% level in a two-tailed test.

		Pilot Sample			Control Sample			Pilot Δ minus
Variable	Market	Pre-Pilot	Pilot	Δ	Pre-Pilot	Pilot	Δ	Control Δ
Skewness—5m	Listed	0.08	0.16	0.08	0.25	0.13	-0.12	0.20
Skewness—5m	Nasdaq	0.29	0.43	0.14	0.22	0.36	0.14	0.00
Skewness—30m	Listed	0.13	0.09	-0.04	0.13	0.13	0.00	-0.04
Skewness—30m	Nasdaq	0.20	0.32	0.12	0.13	0.23	0.10*	0.02

Skewness—day	Nasdaq	0.26	0.35	0.09	0.16	0.29	0.13	0.05

Table 11: Extreme Price Reversals

This table summarizes how the frequency of large negative and positive short-horizon price reversals differs across pilot and control stocks. The numbers in the table represent the number of reversals per 100,000 stock/intervals. A negative (positive) reversal is defined as a negative (positive) return immediately followed by a positive (negative) return. The "size" of the reversal is defined as the minimum absolute value of the two adjacent returns, normalized by the pre-pilot standard deviation of the stock's holding-period return, where the second return is computed as a percentage of the lagged price, and the holding period is five minutes or thirty minutes. The frequency of reversals is computed based on a six-month period following the pilot start date (May 2, 2005). The pre-pilot standard deviation used to normalize the returns is computed over a four-month period prior to the start date. Nonparametric statistical tests based on a bootstrapping procedure determine whether the number of reversals observed in the pilot sample would be statistically rare in the control sample. **, * indicates statistical significance at the 1% and 5% level in a two-tailed test.

Panel A: Five-Minute Return Reversals

	Listed Stocks				Nasdaq Stocks			
	Negative Reversals		Positive Reversals		Negative Reversals		Positive Reversals	
Reversal Size	Pilot	Control	Pilot	Control	Pilot	Control	Pilot	Control

Table 12: Semi-Autoregression Results

This table reports average regression coefficients of returns on lagged positive and negative component returns, for pilot and control stocks before and after the start of the pilot. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The coefficients reported in the table are the mean coefficients across all stocks in the subsample, estimated over the designated period, of the autoregressive model:

$$R_t = \sum_{n=1}^{5} \alpha_n R_{t-n}^{-} + \sum_{n=1}^{5} \beta_n R_{t-n}^{+} .$$

where R_t represents the stock return in period t, and

$$R_t^{-} = \min(0, R_t) \qquad R_t^{+} = \max(0, R_t) .$$

Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test.

Table 13: Sample Deciles

This table shows the number of stocks in each market capitalization, turnover, and short selling decile. The deciles are set so that each decile contains the same number of stocks for the full sample. This table reports the subsample sizes separately for pilot and control stocks and for Listed and Nasdaq NM Stocks. It also gives the proportion of stocks in that decile and market that are pilot or control stocks.

	Listed				Nasdaq			
	Pilot		Control		Pilot		Control	
	Count	Proportion	Count	Proportion	Count	Proportion	Count	Proportion
	Market Capitalization							
Decile								
Lowest	22	33.9	43	66.1	62	28.4	156	71.6

Table 14: Changes in Short Selling Activity Across Market Cap and Turnover Deciles

This table shows the marginal effect of the pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Short Selling Volume}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Short Selling Volume}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the number of shares sold short on a day divided by the total volume on that day. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

	Market Capitalization		Turnover	
	Listed	Nasdaq	Listed	Nasdaq
Decile				
Lowest	-0.26	-1.55**	2.84**	1.44**
2	4.83**	1.68**	2.84**	1.17**

Average R^2	0.10	0.09	0.10	0.09

Table 15: Changes in Nasdaq Market Share Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Nasdaq Market Share}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Nasdaq Market Share}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the Nasdaq share of short selling volume on a day. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. ** indicates that the effect is statistically different from zero at the 1 % level in a two-tailed test.

	Market Capitalization		Turnover

Table 18: Changes in Effective Spread Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Relative Effective Spread}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i + \beta_{11} \text{Pre Relative Effective Spread}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the relative effective spread. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

	Market Capitalization		Turnover

Table 19: Changes in Five-Minute Return Variances across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Variance (5 minute returns)}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i + \beta_{11} \text{Pre Variance(5 minute returns)}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$ multiplied by 10^6. The dependent variable is the five-minute return variance. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

Table 22: Six Month Market Model In-Sample Alphas Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Alpha}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is in-sample alpha estimated for each stock based on the market model. The market model alpha was estimated over the six month period from May 2, 2005 to October 31, 2005 by regressing the daily stock returns on the daily market return, which is represented by the CRSP equally-weighted index returns. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. None of the numbers presented below are significant at the 5% or 1% level.

Appendix A: Concurrent Regulation SHO Pilot Studies

We have identified four concurrent studies that also examine the effect of removing the tick test and/or the bid test during the Regulation SHO Pilot. Much of the analysis is similar to the analysis reported in this report, but the construction of the samples and the focus of the test design differs in important ways. Each approach has its merits. See the attached Table A.1 for a simplified comparison of the approaches.

One main difference between the construction of the samples for this report and the sample construction in the concurrent papers is the incorporation of stocks that might be outliers. This report includes these stocks because they might be the ones most affected by the Pilot. The other studies exclude these stocks in order to improve matching between the pilot and control stocks or to remove the influence of confounding events.

Three academic studies (Alexander and Peterson (2006), Deither, Lee, and Werner (2006), and Wu (2006)) plus the OEA study incorporated a Pre-Pilot period into the study. The design of the Bai (2006) study does not require comparison to a Pre-Pilot period. All studies compared Pilot stocks to Control stocks, but two conducted one-on-one matches (Alexander and Peterson (2006) and Wu (2006)).

Despite the different decisions, many of the results of this report are supported by the results of the concurrent studies. A summary of the results of the three studies most comparable to this report can be found in Table A.2. Bai (2006) is not included because the focus differs from this report. The general results, however, are in line with the results of the academic studies and this report. Specifically, Bai (2006) finds no effect of the pilot on stock price reactions to negative earnings shocks.

Effect of pilot around Negative Earnings Announcements	Effect of increases in short selling on market quality. Plus, effect of pilot on short selling, liquidity, volatility.	Price discovery of short selling. Plus, effect of pilot on short selling, liquidity, volatility, and efficiency of large/small stocks.	Effect of pilot on short selling, liquidity, volatility, market efficiency, and extreme price changes. Plus, differences across large/small and liquid/illiquid stocks

Table A.2: Comparison of Results

Study	Alexander and Peterson (2006)	Diether, Lee, and Werner (2006)	Wu (2006)	SEC
Short Selling	No significant impact on short sale volume for either NYSE or NASDAQ. NYSE: Pilot stocks had a higher number of short sales trades and a lower average short sale trade size. NASDAQ: No impact on number of short sales trades or average short sale trade size.	Higher relative short sale volume. NYSE: higher number of short sale trades No impact on the number of NASDAQ short sale trades.	Examines only short selling on the NYSE Relative short selling increases for pilot stocks. Significant for small stocks but not large stocks.	Higher short sale volume and a higher number of short sale trades. No impact on short interest or days to cover. No impact on option trading volume or open interest. Trading is more balanced for pilot stocks. The increase in short selling is bigger for small stocks.
Liquidity	NYSE: larger spreads, smaller quoted ask depth, smaller quoted bid depth, higher price impact NASDAQ: larger spreads No effect on effective spreads	No impact on NASDAQ stocks. NYSE: Larger quoted, effective, and realized spreads, smaller quoted ask depth, higher relative bid depth, smaller buy imbalances.	Relative effective and quoted spreads increase with pilot by < 1 bps. This is statistically significant only for small stocks. Smaller buy imbalances across all market cap groups. Offer depth declines for most size groups.	Listed: smaller quoted ask depth in univariate and regression. Regression shows decrease in both bid and ask. Some tests show small increases or decreases in realized liquidity.

Study	Alexander and Peterson (2006)	Diether, Lee, and Werner (2006)	Wu (2006)	SEC
Volatility	No impact. The authors examine six volatility measures: 5 minute return volatility, semi-variance, daily relative price range, Fama-French three-factor model idiosyncratic risk, CAPM idiosyncratic risk, and implied volatility.	No increase in the majority of the 26 different volatility measures for Pilot Stocks. NYSE: higher short term volatility (15/5 variance ratio), daily return volatility, trade to trade return volatility, offer to offer quote volatility, five-minute bid and offer volatility, daily up-side and down-side semi-variance. The authors examine semi-variance, trade returns, bid quote returns, and ask quote returns for various time lengths: trade to trade, quote to quote, five-minute, fifteen-minute, and daily. They also examine the 15/5 minute variance ratio.	Variance ratios did not change with pilot. Daily price range and intraday price standard deviation do not change.	Some evidence of an increase in intraday volatility. This appears to be driven by smaller stocks as larger stocks saw a decline in intraday volatility during the pilot. While average daily volatility does not change, smaller stocks experienced lower volatility during the pilot as larger stocks experienced an increase.
Efficiency	No impact except for the following measures for NYSE stocks: higher autocorrelation of five-minute returns, greater likelihood of a lower price for the second trade after a short sale, and greater likelihood of a higher trade price for the first trade after a short sale. The authors examine the autocorrelation of five- and thirty-minute returns, upside minus downside r-squared, and price runs.		Hasbrouck pricing errors show no significant change with pilot. Intraday return autocorrelations (30 and 60 minute) did not change with pilot.	Higher five-minute return reversals. Higher five-minute semi-autoregression. No impact on thirty-minute return reversals, thirty-minute semi-autocorrelation, or on skewness in five-minute, thirty-minute, and daily returns.

Study	Alexander and Peterson (2006)	Diether, Lee, and Werner (2006)	Wu (2006)	SEC
Returns	No significant impact on returns surrounding the announcement date of the Pilot stocks, on the initiation day of the Pilot, or during the first month of the Pilot.			Listed pilot stocks had a 24 bps lower return than control stocks on the initiation day of the Pilot but had statistically similar cumulative return during the 6 months after the Pilot.
Conclusion	Concerns about the removal of the price tests leading to a degradation of market quality are unfounded. Price tests do not further the stated objectives of short sale regulation.	While the suspension of the NYSE tick test is found to be associated with larger spreads and higher short-term volatility, this evidence is consistent with the distorting effects of the tick test on short sellers (i.e., forcing them to be liquidity suppliers) rather than any benefit to investor welfare.	Tick test reduces short selling and narrows the spread primarily for small stocks. Tick test does not seriously constrain short sellers from trading on their information.	Most evidence shows that the pilot had a minor effect. The most intriguing results are in volatility. Some evidence that the tick test has a bigger effect in small stocks.

Open meeting questions:

Q. What evidence would convince OEA that the uptick rule makes economic sense?

A. Statistical evidence that can link the uptick rule to an improvement in the functioning of the market. We have thoroughly analyzed and reviewed the empirical evidence to date. No study of which we are aware provides solid statistical evidence that price restrictions on short sales improve the functioning of the market. However, OEA and other outside researchers continue to evaluate its effect and we invite commenters to send us new evidence on measures not yet explored.

Paredes Q. What is the impact on trading if we were to increase the trading increment above a penny for the price tests? At what increment would the price test become a ban? How would we ascertain what increment would become a ban?

A. A1) Based on statistical evidence based on data from September 2008, an increase in trading increment above the penny would make it very difficult to short a stock with a low bid-ask spread. Low bid-ask spreads occur in actively-traded stocks, low priced stocks, and when stocks are experiencing very little volatility. The bigger the increment, the more restrictive it is in low volatility periods.

A2) Our analysis shows that short selling activity would be deeply constrained in actively traded stocks even for bid increments of one to three cents. For example, we found that for actively-traded ow priced stocks a bid increment of three cents would prevent short sales from executing during 99% of the trading day (with a one-cent bid increment, the execution rate would be approximately 60%).

A3) Our analysis simulated the submission of small short sale orders during the actual conditions that existed in mid-September. We then studied how long it took to see an execution that would abide by a price test and whether the simulated short sale would execute within a minute, which is a very long time to traders. If a short sale rarely has a chance to execute during a one-minute period, then the rule is effectively a ban.

Paredes Q. Is there a link between the market decline and short selling?

A. We found that at the individual stock level, on average, short selling activity is higher when prices are advancing. In particular, for extreme negative and extreme positive returns in a stock, short selling activity in that stock is higher during periods of positive returns. In an analysis of the volatile periods last September, we found that long sales tended to be more aggressively priced than short sales even when prices were rapidly declining, suggesting that sales by owners tended to put more price pressure on stocks than did short sellers.

We observed that this regularity is not necessarily as strong for the case of stocks of companies under stress during periods of high volatility.

Open meeting questions:

Paredes Q. Please discuss the consequences of a short sale price test on market quality, liquidity, etc.

A. Most research suggests that a short sale price test has very little effect on market quality and liquidity. For example, the OEA Pilot study found that price tests have an effect on displayed depth and short-term intraday volatility, but do not have a deleterious impact on market quality or liquidity. While we found that displayed depth on the offer side decreased, this effect did not impact realized trading costs as measured by effective spreads. The intraday volatility results were mixed – smaller stocks experienced an increase in volatility while larger stocks experienced a decline in volatility during the Pilot.

A recent paper by Boehmer, Jones, and Zhang (2008) suggests that price tests result in a small improvement in liquidity, as measured by effective spreads (about 1 basis point), but this result is potentially confounded by a large change in market conditions during their study period. Conversely, they also find "no evidence that repeal of the uptick rule destabilized prices." (or led to widespread "bear raids").

Comment [OEA1]: Perhaps we should skip this detail so that our answer is more concise.

Deleted: on the effect of the repeal of price tests provides additional evidence that is mixed. On the one hand, they find a

Deleted: increase in effective spreads

Deleted: after the repeal

Deleted: Evidence suggests that a short sale price test has very little effect on market quality. [expand a little]

Shapiro/Walter Q. What has been the experience during the crisis of countries that have an uptick rule?

A. OEA examined whether last fall's volatility differed for the U.S. than for other countries, including those that have an uptick rule. Except for Australia, which applied an uptick rule only to naked short sales, the increases in volatility in countries with an uptick rule were similar to or higher than the increases in volatility in the U.S. For example, Japan and Hong Kong experienced notably higher volatility than the US, peaking around 100 percent as compared to about 70 percent in the US. In addition, all major markets around the world experienced a similar pattern with volatility increasing a lot in September and peaking in November.

Q. Has there been new evidence on uptick rules since the Pilot Study?

A. Yes. We have reviewed many letters sent by the public containing evidence regarding the uptick rule. Most of this evidence does not meet statistical standards of hypothesis testing. However, we are aware of one academic study by Boehmer, Jones, and Zhang that examined the repeal of the uptick and bid test rules and we have conducted our own analyses of various issues related to the uptick rule. This evidence does not support the hypothesis that the uptick rule, or similar rules, would have <dampened the volatility of the financial crisis> <improved market quality> <other language>.

Q. Is there any evidence that the rules are effective in extreme conditions?

A. OEA's Pilot Study and some of the earlier studies did examine the effectiveness of uptick rules during extremes. For example, the uptick rule did not prevent short selling during the

Open meeting questions:

market crash of 1987. More recently, OEA found that an uptick-like rule would have restricted short selling more during the calm periods of this past September than when prices were rapidly moving down.

Q. What do you know about the interaction between credit default swaps and short selling?

A.

Q. (Potential questions on cost benefit) Are there any differences in the costs of each proposal? What are the costs of each proposal? What are the benefits of each proposal?

A. We have included questions in the release that seek comment on the costs of each proposal and the cost differences among the proposals. We have also included questions in the release that seek comment on the benefits of each proposal.

Page 1: [1] Deleted **OEA** **4/7/2009 5:28:00 PM**

By independent, we mean that each order submitted was an unrelated event. We selected a small order size because it allowed for a more precise estimation of execution rates and time to execution. In our exercise orders were submitted at a constant rate and were canceled only when the 60 second period had closed. In real markets, the submission of short sale orders occurs at different rates depending of market conditions. In addition orders might be canceled at high frequencies as changes in the order book dictate changes in the limit orders

Page 1: [2] Deleted **OEA** **4/7/2009 5:35:00 PM**

Page 1: [3] Deleted **OEA** **4/7/2009 5:37:00 PM**

positive returns are associated with higher levels of short selling activity.

INTEROFFICE MEMORANDUM

TO: MICHAEL POST

ERIK SIRRI, BOB COLBY, MARLON PAZ, JAMIE BRIGAGLIANO, JOSEPHINE TAO, AND TORY CRANE

FROM: AMY K EDWARDS

SUBJECT: ANALYSIS OF THE EFFECT OF FAILING TO DELIVER ON RETURNS

DATE: 2/26/2010

CC: JIM OVERDAHL, STEWART MAYHEW, AND TIM MCCORMICK

This memo summarizes findings from a preliminary study of the effect of failing to deliver on returns. The objective of the study is to examine whether the trades that result in an increase in fails appear to drive prices downward. The idea is that a result that fails tend to be associated with a drop in price suggests that regulations that penalize participants for fails might make manipulations more difficult and could potentially improve market efficiency. Overall, we do not find evidence that increases in fails or persistent fails are systematically associated with trades that drive prices downward.[1] Therefore, this analysis is unable to provide empirical support for arguments that failures to deliver harm pricing efficiency.

Summary of the Results:

- Trades resulting in increases in *aggregate* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.
- Trades resulting in *persistent* increases in *aggregate* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.
- Trades resulting in *transitory* increases in *aggregate* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.
- Trades resulting in *persistent* increases in *clearing member* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.

[1] A systematic negative association would imply that fails are regularly associated with trades that drive prices downward. The absence of a systematic association does not rule out isolated instances, but it does mean that these isolated instances are not significant enough to influence the overall averages.

- Trades resulting in *transitory* increases in *clearing member* failures to deliver are not systematically associated with a security's price regardless of the threshold status of the security.

Sample

We started with a sample of securities for which we had return or failure to deliver information for 2006. We delete securities if we do not have price or return data for that security and we delete securities if we do not have fail to deliver data for that security.[2] This yields a sample of 7,945 securities.

Studies commonly screen out securities that are delisted before the end of the sample period or that were listed after the start of the sample period. We do not screen these observations out. Instead, we require only that the security have at least 60 days (one quarter) of trading information. Therefore, our results may be affected by IPOs, firms that did not survive the year, and/or firms that are delisted from a market such that their prices are no longer included in our data. We believe that this sample represents the universe of non-OTC stocks well.

Analysis

We examine failures to deliver and returns on each *trading day* in 2006. For a given trading day, we compare the return to the change in failures to deliver from two to three *settlement days* after the trading day. Our concern is on whether there is evidence that trading that results in an increase in fails causes downward price pressure. In this situation, an increase in fails should be preceded by negative returns three settlement days earlier. Statistically, this means that we expect fails to be negatively correlated with preceding returns. Therefore, our null and alternative hypotheses are as follows:

Null Hypothesis (H_0): trading that results in an increase in failures to deliver has no effect on prices. Statistically, this means fails are not correlated with returns three days earlier.

Alternative Hypothesis (H_{A1}): trading that results in an increase in failures to deliver depresses security prices. Statistically, this means fails are negatively correlated with returns three days earlier.

We add a second alternative hypothesis because fails could also be due to liquidity suppliers such as market makers selling during price increases.

Second Alternative Hypothesis (H_{A2}): trading that results in an increase in failures to deliver comes from liquidity provision. Statistically, this means increases in aggregate fails are positively correlated with returns three days earlier.

[2] We receive failure to deliver data from the NSCC for equity securities with failures to deliver of at least 10,000 shares on a particular date. Therefore, we cannot differentiate no fails from fails of less than 10,000 shares.

SEC_OEA_FCIC_001373

We care about whether the correlation between an increase in fails and returns is stronger for securities that are on the Regulation SHO threshold list (i.e., already have significant fails) or when the increase in fails contributes to a security qualifying for the threshold list. Therefore, we designed our tests not only to measure the correlation between an increase in fails and returns, but to also measure any differential effect on this correlation of a security's threshold status. This helps us understand whether the economic effect of failures to deliver on stock prices is any different when a security is a threshold security. We consider whether the security is on the threshold list on the same day as an increase in fails and also whether the increase in fails might contribute to the security being added to the threshold list.

With these objectives in mind, we designed the following regression equation to estimate our tests:

$$R_{it} = \alpha + \beta_1 \Delta F^{+}_{it} + \beta_2 th^{3}_{it} \Delta F^{+}_{it} + \beta_3 th^{4,8}_{it} \Delta F^{+}_{it} + \varepsilon_{it} \qquad (1)$$

where R_{it} is the return for security i from t-1 to t, ΔF^{+}_{it} is the change in failures to deliver for security i from t+2 to t+3, if the change is positive, th^{3}_{it} is a dummy variable indicating that the stock is on the threshold list on day t+3, and $th^{4,8}_{it}$ is a dummy indicating that the stock is not on the threshold list on day t+3 but is added to the list by day t+8. In this model, β_1 is negative under the hypothesis that failures to deliver depress prices. A negative β_2 would indicate that failures to deliver depress prices in threshold securities more than they do in other securities. Adding β_1 to β_2 tells us the total effect of an increase in fails on returns in a threshold security. A negative β_3 would indicate that failures to deliver depress stock prices more when they occur just prior to a security qualifying for the threshold list than at other times. Adding β_1 to β_3 tells us the total effect on returns of an increase in fails that contributes to a security qualifying for the threshold list.

There are two serious considerations when interpreting the results of this regression. The regression is designed to examine associations and not causations. Therefore, while this memo mentions "effects", these tests really only measure associations. In addition, these regression coefficients will not allow us to distinguish a negative correlation associated with systematic manipulation, which reduces pricing efficiency, from a negative correlation associated with price discovery, which is important for pricing efficiency. Therefore, if we find that increases in fails are associated with negative returns, we will need to run additional tests to examine causation and whether increases in failures to deliver improve or reduce pricing efficiency.

Results for Aggregate Fails

We first estimate the regression in equation (1) for failures to deliver aggregated by security on each date on a data set containing each security that is in our sample for at least one quarter in 2006. Table 1 shows the coefficients that result from estimating equation (1).[3] The equation is

[3] We estimate this in a pooled regression that adjusts the variance-covariance matrix for cross-sectional heteroskadasticity. This heteroskadasticity exists because of the large cross-sectional variation in fails across stocks.

SEC_OEA_FCIC_001374

estimated for failures to deliver measured in units of 10,000 shares and also for failures to deliver measured as a percentage of shares outstanding. The table also shows whether the coefficient is statistically different from zero based on a t-test.

Table 1: Results of a Pooled Regression of Returns on Aggregate Fails

$$R_{it} = \alpha + \beta_1 \Delta F_{it}^{+} + \beta_2 th_{it}^{3} \Delta F_{it}^{+} + \beta_3 th_{it}^{4,8} \Delta F_{it}^{+} + \varepsilon_{it}$$

β_1 measures the effect on returns of trading that resulted in an increase in fails. β_2 measures the difference in effect on returns when the security is on the threshold list. β_3 measures the difference in effect on returns when the increase in fails contributed to threshold qualification. The effect on returns is given in basis points. Statistical significance at the 10, 5 and 1% level is indicated by *, **, or ***.

Measurement of Fails:	In units of 10,000 shares	In units of 1% of shares outstanding
α	61.48***	61.41***
β_1	-0.09	>-0.01
β_2	-0.07	-0.01
β_3	-0.09	-0.01
$\beta_1 + \beta_2$	-0.17	-0.01
$\beta_1 + \beta_3$	-0.18	-0.01

The results for β_1 show that during 2006, each 10,000 increase in failures to deliver is associated with a 0.09 basis point decline in stock value, or each increase in failures to deliver of 1% of the shares outstanding is associated with a price decline of less than 0.01 basis points. In addition to being very small economically, neither of these results is statistically different than zero. This means that the effect on returns is unlikely to be meaningfully negative. Likewise, the results for β_2 and β_3 are also small and insignificant. Even when β_2 and β_3 are added to β_1, the effect on returns is small. Therefore, the results from Table 1 indicate that an increase in failures to deliver has no economic effect on stock prices.

Decomposing Fails

We next attempt to capture the effect of longer lived fails by separating the part of the increase in fails that is due to long-lived, or persistent, fails and short-lived, or transitory, fails. We do this by measuring how much of the increase in fails persists for five days. To see how we measured this, consider Figure 1. The increase from t-1 to t can be divided into a transitory portion (T) and a persistent portion (P) as defined by the level of fails in the five days following an increase so that the change on day t, ΔF, will be equal to T + P. The permanent portion is the part of the change in fails that appears to last at least 5 days. By contrast, the transitory portion is the portion that appears to last less than 5 days.

Note that we cannot exactly tell if any of the fails on t+1 are associated with same fails on t. Further, we assume that any decrease in fails offsets the most recent fail. Alternatively, we could have assumed that a decrease in fails offset the oldest fail. Therefore, this analysis is an approximation.

Some stocks rarely have fails and never have large fails, while others have fail levels that vary widely from day to day.

SEC_OEA_FCIC_001375

Figure 1

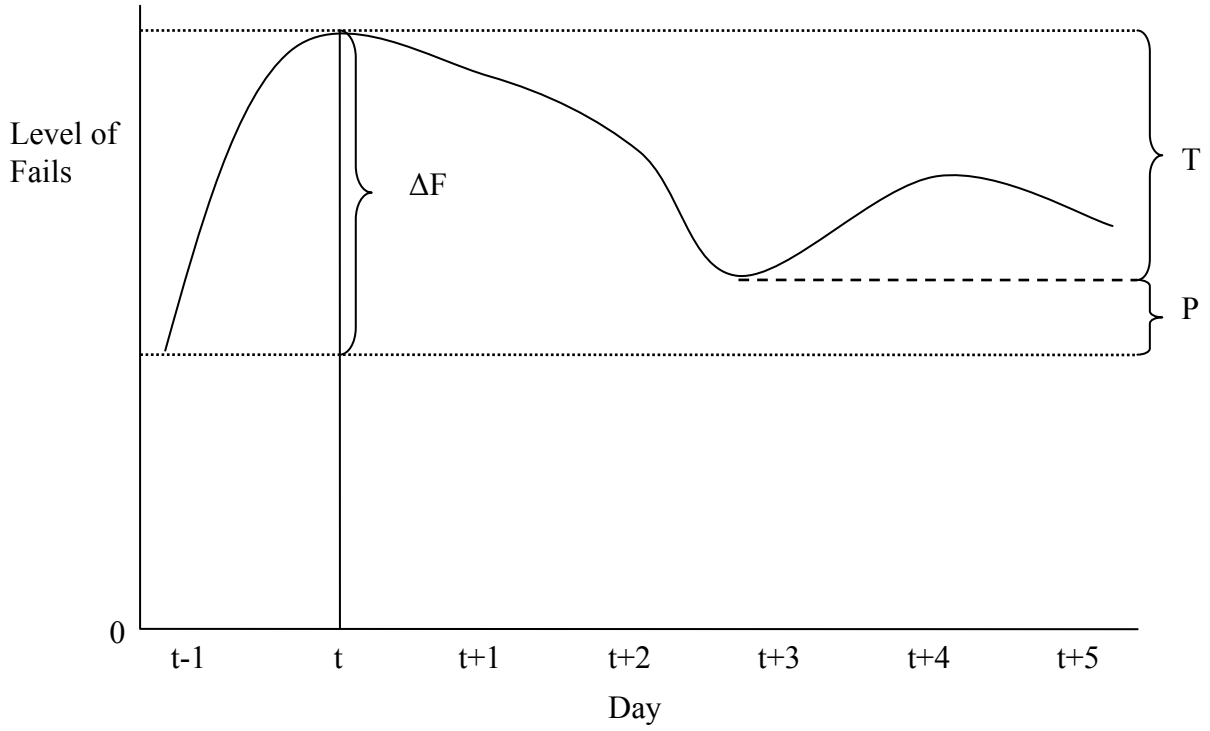

Figure 1 represents a simple case when fails decline following t but do not fall below the t-1 level. Figure 2 shows how we measure transitory and permanent fails for several other scenarios. Note that transitory fails, T, can never be less than 0 and can never be greater than the change in fails on day t, ΔF. Likewise, permanent fails, P also range only from 0 to ΔF. In figure 2a, fails increase after day t and remain above the level on day t for the next five days. In this case, all of the change from t-1 to t is considered permanent and none of the fails can be called transitory. So, P = ΔF and T = 0. By contrast, Figure 2b shows a situation in which the fails increase after day t but fall back below the day t level. As in Figure 1, we can use the lowest fail level to estimate how much of ΔF appears to be cleared within five days. The remaining portion of ΔF is called permanent. In Figures 2c and 2d, the fails level falls below the level on t-1 so none of ΔF can be called permanent. This is true whether the level stays below the level on t-1 (2c) or rises back above that level within five days (2d).

SEC_OEA_FCIC_001376

Figure 2a

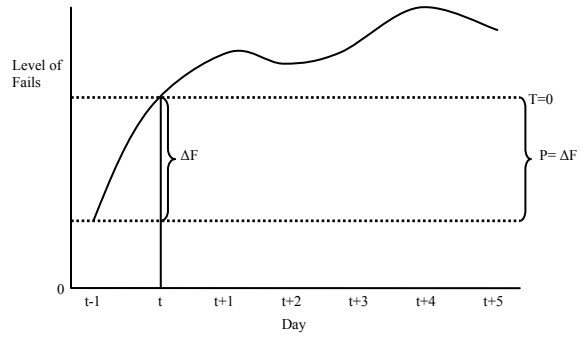

Figure 2b

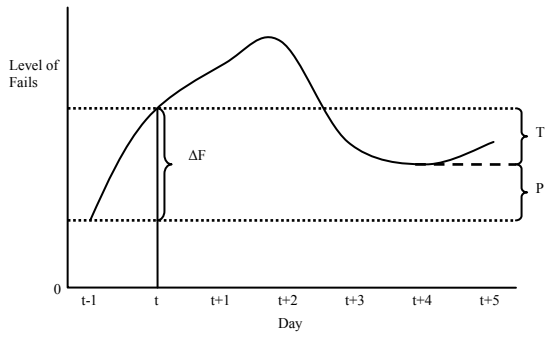

Figure 2c

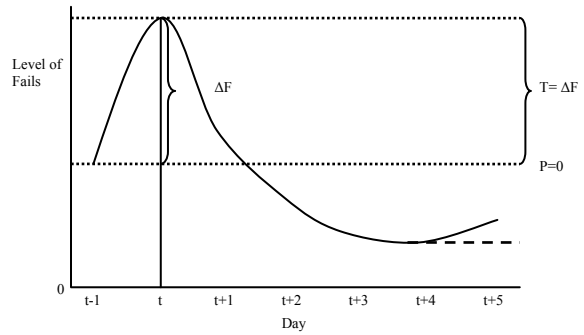

Figure 2d

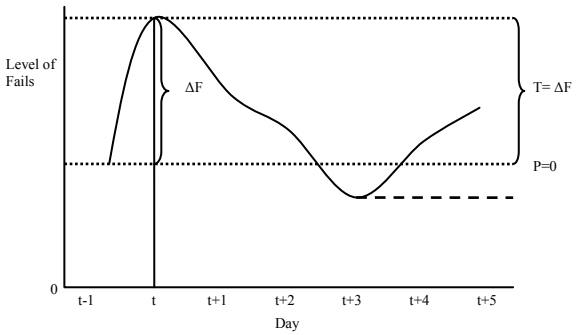

Results for Decomposed Aggregate Fails

To examine the effect of persistent and transitory fails on prices, we adjust equation (1) as follows:

$$R_{it} = \alpha + \beta_{1p}\Delta F_{it}^{p} + \beta_{2p} th_{it}^{3}\Delta F_{it}^{p} + \beta_{3p} th_{it}^{4,8}\Delta F_{it}^{p} + \beta_{1t}\Delta F_{it}^{t} + \beta_{2t} th_{it}^{3}\Delta F_{it}^{t} + \beta_{3t} th_{it}^{4,8}\Delta F_{it}^{t} + \varepsilon_{it} \qquad (2)$$

$\Delta F^{p}{}_{it}$ is the portion of the change in failures to deliver for security i from t+2 to t+3 that persists for five more days, if the change from t+2 to t+3 is positive. Likewise, $\Delta F^{t}{}_{it}$ is the portion of the change in failures to deliver for security i from t+2 to t+3 that does not persist for five more days, if the change from t+2 to t+3 is positive. In this model, β_{1p} is negative under the hypothesis that persistent failures to deliver depress prices. A negative β_{2p} would indicate that persistent failures to deliver depress prices in threshold securities more than they do in other securities. Adding β_{1p} to β_{2p} tells us the total effect on returns of a persistent fail in a threshold security. A negative β_{3p} would indicate that persistent failures to deliver depress stock prices more when they occur just prior to a security qualifying for the threshold list than at other times. Adding β_{1p} to β_{3p} tells us the total effect on returns of a persistent fail that contributes to a security qualifying for the threshold list.

SEC_OEA_FCIC_001377

Table 2 gives the estimated coefficients of the equation (2) regression estimated for failures to deliver aggregated by security on each date in a data set containing each security that is in our sample for at least one quarter in 2006.

Table 2: Results of a Pooled Regression of Returns on Decomposed Aggregate Fails

$$R_{it} = \alpha + \beta_{1p}\Delta F_{it}^{p} + \beta_{2p} th_{it}^{3}\Delta F_{it}^{p} + \beta_{3p} th_{it}^{4,8}\Delta F_{it}^{p} + \beta_{1t}\Delta F_{it}^{t} + \beta_{2t} th_{it}^{3}\Delta F_{it}^{t} + \beta_{3t} th_{it}^{4,8}\Delta F_{it}^{t} + \varepsilon_{it}$$

β_1 measures the effect on returns of trading that resulted in an increase in fails. β_2 measures the difference in effect on returns when the security is on the threshold list. β_3 measures the difference in effect on returns when the increase in fails contributed to threshold qualification. The effect on returns is given in basis points. Statistical significance at the 10, 5 and 1% level is indicated by *, **, or ***.

Measurement of Fails:	In units of 10,000 shares	In units of 1% of shares outstanding
α	61.42***	61.42***
Persistent fails		
β_{1p}	-7.67	-0.06
β_{2p}	7.44	0.05
β_{3p}	7.01	0.04
$\beta_{1p} + \beta_{2p}$	-0.23	-0.01
$\beta_{1p} + \beta_{3p}$	-0.66	-0.03
Transitory fails		
β_{1t}	-0.08	>-0.01
β_{2t}	0.27	0.01
β_{3t}	-0.01	<0.01
$\beta_{1t} + \beta_{2t}$	0.19	0.01
$\beta_{1t} + \beta_{3t}$	-0.08	<0.01

The results for persistent fails show that a prices decline of more than 7 basis points is associated with each 10,000 share increase in fails. While this result is economically larger than the result in Table 1, it is still not statistically significant. This means that there is too much statistical uncertainty to conclude that persistent fails have a negative impact on prices.

The marginal effect when a stock is on the threshold list is positive and nearly offsets the average negative effect on returns. This means that when a stock is on the threshold list, the effect on returns of a persistent fail appears less negative than when it is not on the threshold list. However, neither this marginal impact nor the total effect on returns of a persistent 10,000 share fail in a security on the threshold list is significantly different than zero. Therefore, we cannot conclude that a persistent 10,000 share fail in a stock on the threshold list has any association with returns. Likewise, the results do not allow us to say that a persistent 10,000 share fail is associated with an increase in fails that contributes to the security qualifying for the threshold list.

The persistent fail results are similar when fails are scaled by shares outstanding. A persistent fail of 1% of the shares outstanding does not have a statistically significant effect on returns, regardless of the threshold list status of the security.

The magnitude of the effect on returns of transitory fails appears much smaller than the effect on returns of persistent fails. However, because neither is statistically different from zero, it is

SEC_OEA_FCIC_001378

unlikely that they are statistically different from each other. Therefore, we can't conclude that one is larger than the other. In fact, the conclusions on transitory fails are the same as the conclusions on persistent fails. The effect on returns is insignificant, regardless of threshold status.

Results for Clearing Member Fails

One potential explanation for the lack of results on persistent and transitory fails is that the aggregate fails might not capture the persistent fails well if there fails come from multiple clearing members. Instead, a more accurate measure of persistent fails can be obtained by considering unaggregated fails, or fails at the clearing member level. We next repeat our analysis of persistent and transitory failures to deliver using persistent fails as estimated at the clearing member level. Specifically, for every clearing member in every stock, we decompose each increase in fails into persistent and transitory components. We then aggregate across clearing members to get new estimates of persistent and transitory fails for each stock on each day. This new estimate is different from the aggregate estimates above because a clearing member might have an increase in fails on a day when aggregate fails decrease for a security.

We re-estimate equation (2) using our new measures of persistent and transitory fails. The results are given in Table 3. As in Table 2, some of the effect on returnss appear positive and some appear negative, but none are statistically different than zero. Therefore, even when considering fails at the clearing member level, we have no evidence that trades resulting in failures to deliver push price down.

Table 3: Results of a Pooled Regression of Returns on Decomposed Clearing Member Fails

$$R_{it} = \alpha + \beta_{1p}\Delta F_{it}^{p} + \beta_{2p} th_{it}^{3}\Delta F_{it}^{p} + \beta_{3p} th_{it}^{4,8}\Delta F_{it}^{p} + \beta_{1t}\Delta F_{it}^{t} + \beta_{2t} th_{it}^{3}\Delta F_{it}^{t} + \beta_{3t} th_{it}^{4,8}\Delta F_{it}^{t} + \varepsilon_{it}$$

β_1 measures the effect on returns of trading that resulted in an increase in fails. β_2 measures the difference in effect on returns when the security is on the threshold list. β_3 measures the difference in effect on returns when the increase in fails contributed to threshold qualification. The effect on returns is given in basis points. Statistical significance at the 10, 5 and 1% level is indicated by *, **, or ***.

Measurement of Fails:	In units of 10,000 shares	In units of 1% of shares outstanding
α	200.27***	195.44***
Persistent fails		
β_{1p}	-1.31	-0.25
β_{2p}	0.90	0.01
β_{3p}	7.23	0.32
$\beta_{1p} + \beta_{2p}$	-0.41	-0.23
$\beta_{1p} + \beta_{3p}$	5.92	0.07
Transitory fails		
β_{1t}	-3.96	-0.02
β_{2t}	3.78	>0.01
β_{3t}	1.39	-3.32
$\beta_{1t} + \beta_{2t}$	-0.18	-0.02
$\beta_{1t} + \beta_{3t}$	-2.57	-3.34

SEC_OEA_FCIC_001379

Discussion of the results

In the tables above, we can find no evidence that trades resulting in failures to deliver are associated with either positive or negative price returns. This result holds whether a security is on the threshold list or whether the failures contribute to the security's threshold status. This result also holds whether we examine aggregate fails or clearing member fails. Because we are unable to find an association between fails and returns, there is no need to examine causation. Therefore, this analysis provides evidence that failures to deliver have no effect on prices and therefore, this analysis suggests that policies seeking to reduce failures to deliver are unlikely to significantly effect pricing efficiency or price discovery.

SECURITIES AND EXCHANGE COMMISSION

17 CFR PART 242

[Release No. 34- ; File No. S7-08-09]

RIN 3235-AK35

Amendments to Regulation SHO

AGENCY: Securities and Exchange Commission.

ACTION: Final rule.

SUMMARY: The Securities and Exchange Commission ("Commission") is adopting amendments to Regulation SHO under the Securities Exchange Act of 1934 ("Exchange Act"). We are adopting a short sale-related circuit breaker that, if triggered, will impose a restriction on the prices at which securities may be sold short ("short sale price test" or "short sale price test restriction"). Specifically, the Rule requires that a trading center establish, maintain, and enforce written policies and procedures reasonably designed to prevent the execution or display of a short sale order of a covered security at a price that is less than or equal to the current national best bid if the price of that covered security decreases by 10% or more from the covered security's closing price as determined by the listing market for the covered security as of the end of regular trading hours on the prior day. In addition, the Rule requires that the trading center establish, maintain, and enforce written policies and procedures reasonably designed to impose this short sale price test restriction for the remainder of the day and the following day when a national best bid for the covered security is calculated and disseminated on a current and continuing basis by a plan processor pursuant to an effective national market system plan. We believe it is appropriate at this time to adopt a short sale-related circuit breaker because, when triggered, it will prevent short selling, including potentially manipulative or abusive short selling,

from driving down further the price of a security that has already experienced a significant intra-day price decline, and will facilitate the ability of long sellers to sell first upon such a decline. This approach establishes a narrowly-tailored Rule that will target only those securities that are experiencing significant intra-day price declines. We believe that addressing short selling in connection with such declines in individual securities will help address erosion of investor confidence in our markets generally.

In addition, we are amending Regulation SHO to provide that a broker-dealer may mark certain qualifying sell orders "short exempt." In particular, if the broker-dealer chooses to rely on its own determination that it is submitting the short sale order to the trading center at a price that is above the current national best bid at the time of submission or to rely on an exception specified in the Rule, it must mark the order as "short exempt." This "short exempt" marking requirement will aid surveillance by self-regulatory organizations ("SROs") and the Commission for compliance with the provisions of Rule 201 of Regulation SHO.

DATES: Effective Date: [Insert date 60 days after publication in the Federal Register.]

Compliance Date: [Insert date 6 months from Effective Date.]

FOR FURTHER INFORMATION CONTACT: Josephine J. Tao, Assistant Director; Victoria Crane, Branch Chief; Katrina Wilson, Staff Attorney; and Angela Moudy, Staff Attorney, Division of Trading and Markets, at (202) 551-5720, at the Commission, 100 F Street, NE, Washington, DC 20549-6628.

SUPPLEMENTARY INFORMATION: The Commission is amending Rules 200(g) and 201 of Regulation SHO [17 CFR 242.200(g) and 17 CFR 242.201] under the Exchange Act.

I. Executive Summary

In July 2007, the Commission eliminated all short sale price test restrictions. Prior to that time, short sale price test restrictions included Rule 10a-1 under the Exchange Act, also known as the "uptick rule" or "tick test" ("former Rule 10a-1"), that applied to exchange-listed securities,[1] and the National Association of Securities Dealers, Inc.'s ("NASD")[2] bid test, Rule 3350 ("NASD's former bid test"), that applied to certain Nasdaq securities.[3] The Commission's removal of short sale price test restrictions followed a careful, deliberative rulemaking process, carried out in multiple stages from 1999 through 2006, and was open to the public at every stage.

The Commission took a number of steps as part of that process, including seeking extensive public comment and conducting a comprehensive staff study to assess whether then-current short sale price test restrictions were appropriate. For example, beginning in 1999, the Commission published a concept release in which it sought comment regarding short sale price test regulation, including comment on whether to eliminate such regulation.[4] In 2004, the Commission initiated a year-long pilot ("Pilot") to study the removal of short sale price tests for approximately one-third of the largest stocks.[5] Short sale data was made publicly available during this Pilot to allow the public and Commission staff (the "Staff") to study the effects of eliminating short sale price test restrictions. The findings of third party researchers were

presented and discussed in a public Roundtable in September 2006.[6] In addition, the results of the Staff study of the Pilot data were made publicly available in draft form in September 2006 and in final form in February 2007.[7]

Since then, there has been significant market turmoil. Concurrent with the development of the subprime mortgage crisis and credit crisis in 2007, market volatility, including steep price declines, particularly in the stocks of certain financial services companies, increased markedly in the U.S. and in every major stock market around the world (including markets that continued to operate under short sale price test restrictions).[8] As market conditions continued to worsen, investor confidence eroded, and the Commission received many requests from the public to consider imposing restrictions with respect to short selling, based in part on the belief that such action would help restore investor confidence.[9]

We determined that it was appropriate to re-examine the appropriateness of short sale price test restrictions and seek comment on whether to restore any such restrictions. Thus, in April 2009 we proposed two approaches to restrictions on short selling, one that would apply on a permanent, market-wide basis and another that would apply to a particular security upon a significant decline in the price of that security (the "proposed circuit breaker approach" or "proposed circuit breaker rules").[10]

9 See id.

10 See Proposal, 74 FR 18042.

SEC_OEA_FCIC_001386

With respect to the permanent, market-wide approach, we proposed two alternative price tests. The first alternative price test, in many ways similar to NASD's former bid test, would be based on the national best bid (the "proposed modified uptick rule"). The second alternative price test, similar to former Rule 10a-1, would be based on the last sale price (the "proposed uptick rule").

With respect to the proposed circuit breaker approach, we proposed two basic alternatives. First, we proposed a circuit breaker rule that, when triggered by a significant price decline in a particular security, would temporarily prohibit any person from selling short that security, subject to certain exceptions ("proposed circuit breaker halt rule"). Second, we proposed a circuit breaker rule that, when triggered by a significant price decline in a particular security, would trigger a temporary short sale price test for that security. In connection with this alternative, we proposed two short sale price tests. One was the modified uptick rule – that is, we proposed a circuit breaker rule that, when triggered by a significant price decline in a particular security, would temporarily impose the proposed modified uptick rule for that security ("proposed circuit breaker modified uptick rule"). The other was the uptick rule – that is, we proposed a circuit breaker rule that, when triggered by a significant market decline in a particular security, would temporarily impose the proposed uptick rule for that security ("proposed circuit breaker uptick rule").

In addition, in the Proposal we inquired whether a short sale price test restriction that would permit short selling at a price above the current national best bid (the "alternative uptick rule"), would be preferable to the proposed modified uptick rule and the proposed uptick rule.[11] We sought comment regarding the application of the alternative uptick rule as a market-wide

[11] See Proposal, 74 FR at 18072, 18081, 18082.

SEC_OEA_FCIC_001387

permanent short sale price test restriction or in conjunction with a circuit breaker.[12] As a supplement to our request for comment in the Proposal and to help ensure the public had a full opportunity to comment on, among other things, the alternative uptick rule, on August 20, 2009 we re-opened the comment period to the Proposal.[13] In addition, on May 5, 2009, we held a Roundtable to Examine Short Sale Price Test and Circuit Breaker Restrictions (the "May 2009 Roundtable").[14] Panelists included representatives of public issuers, investors, financial services firms, SROs and the academic community.[15]

Although in recent months there has been an increase in stability in the securities markets, we remain concerned that excessive downward price pressure on individual securities accompanied by the fear of unconstrained short selling can undermine investor confidence in our markets generally.[16] In addition, we are concerned about potential future market turmoil, including significant increases in market volatility and steep price declines. Thus, as discussed in more detail below, after considering the comments, we have determined that it is appropriate at this time to adopt in Rule 201 a targeted short sale price test restriction that will apply the alternative uptick rule for the remainder of the day and the following day if the price of an

[16] We note that investor confidence may include a number of different elements, such as investor perceptions about fundamental market risk, investor optimism about the economy, or investor trust in the fairness of financial markets as influenced by applicable regulatory protections. Although the latter can be directly influenced by Commission actions, the Commission does not have control over fundamental market risk and economic optimism. Thus, as used here, the term "investor confidence" refers to investor trust in the fairness of financial markets.

SEC_OEA_FCIC_001388

individual security declines intra-day by 10% or more from the prior day's closing price for that security as determined by the covered security's listing market.

By not allowing short sellers to sell at or below the current national best bid while the circuit breaker is in effect, the short sale price test restriction in Rule 201 will allow long sellers, who will be able to sell at the bid, to sell first in a declining market for a particular security. As the Commission has noted previously in connection with short sale price test restrictions, a goal of such restrictions is to allow long sellers to sell first in a declining market.[17] A short seller that is seeking to profit quickly from accelerated, downward market moves may find it advantageous to be able to short sell at the current national best bid. In addition, by making such bids accessible only by long sellers when a security's price is undergoing significant downward price pressure, Rule 201 will help to facilitate and maintain stability in the markets and help ensure that they function efficiently. It will also help restore investor confidence during times of substantial uncertainty because, once the circuit breaker has been triggered for a particular security, long sellers will have preferred access to bids for the security, and the security's continued price decline will more likely be due to long selling and the underlying fundamentals of the issuer, rather than to other factors.

In addition, combining the alternative uptick rule with a circuit breaker will strike the appropriate balance between our goal of preventing short selling, including potentially manipulative or abusive short selling, from being used as a tool to exacerbate a declining market in a security and the need to allow for the continued smooth functioning of the markets,

[17] See Exchange Act Release No. 48709 (Oct. 28, 2003), 68 FR 62972, 62989 (Nov. 6, 2003) ("2003 Regulation SHO Proposing Release"); see also Exchange Act Release No. 30772 (June 3, 1992), 57 FR 24415, 24416 (June 9, 1992) (stating that former Rule 10a-1 was "designed to limit short selling of a security in a declining market, by requiring, in effect, that each successive lower price be established by a long seller").

SEC_OEA_FCIC_001389

including the provision of liquidity and price efficiency in the markets.[18] The circuit breaker approach of Rule 201 will help benefit the market for a particular security by allowing participants, when a security is undergoing a significant intra-day price decline, an opportunity to re-evaluate circumstances and respond to volatility in that security. We also believe that a circuit breaker will better target short selling that may be related to potential bear raids[19] and other forms of manipulation that may be used to exacerbate a price decline in a covered security.

At the same time, however, we recognize the benefits to the market of legitimate short selling, such as the provision of liquidity and price efficiency. Thus, by imposing a short sale price test restriction only when an individual security is undergoing significant downward price pressure, the short sale price test restrictions of Rule 201 will apply to a limited number of securities, rather than to all securities all the time. As discussed in more detail below,[20] in response to our request for comment on an appropriate threshold at which to trigger the proposed circuit breaker short sale price test restrictions, commenters submitted estimates of the number of securities that would trigger a circuit breaker rule at a 10% threshold.[21] While commenters'

---

[18] Where we use the terms "market efficiency" and "price efficiency" in this adopting release we are using terms of art as used in the economic literature proceeding under the "efficient markets hypothesis," under which financial prices are assumed to reflect all available information and accordingly adjust quickly to reflect new information. See, e.g., Eugene F. Fama, 1991, Efficient capital markets: II, Journal of Finance; 46: 1575-1617; Eugene F. Fama and Kenneth R. French, 1992, The Cross-Section of Expected Stock Returns, Journal of Finance, 47: 427-465. It should be noted that economic efficiency and price efficiency are not identical with the ordinary sense of the word "efficiency."

[19] See infra note 36 and accompanying text.

[20] See infra Section III.A.5. (discussing the circuit breaker trigger level).

[21] See, e.g., letter from Mary Lou Von Kaenel, Managing Director, Management Consulting, Jordan & Jordan, dated June 19, 2009 ("Jordan & Jordan"); letter from John C. Nagel, Managing Director and Deputy General Counsel, Citadel Investment Group, John Liftin, Managing Director and General Counsel, The D.E. Shaw Group, and Mark Silber, Executive Vice President, Renaissance Technologies, dated June 19, 2009 ("Citadel et al. (June 2009)"); letter from Stuart J. Kaswell, Executive Vice President, Managing Director and General Counsel, Managed Funds Association, dated June 22, 2009 ("MFA (June 2009)"); letter from Ira D. Hammerman, Senior Managing Director and General Counsel, Securities Industry and Financial Markets Association, dated June 19, 2009 ("SIFMA (June 2009)"); letter from Daniel Mathisson, Managing Director, Credit Suisse Securities (USA), LLC, dated Sept. 21, 2009 ("Credit Suisse (Sept. 2009)").

SEC_OEA_FCIC_001390

analyses (including the facts and assumptions used) and their resulting estimates varied,[22] commenters' estimates reflect that a 10% circuit breaker threshold, on average, should affect a limited percentage of covered securities.[23] Given the variations in the facts and assumptions underlying the estimates submitted by commenters, the Staff also looked at trading data to confirm the reasonableness of those estimates. The Staff found that, during the period covering April 9, 2001 to September 30, 2009,[24] the price test restrictions of Rule 201 would have been triggered, on an average day, for approximately 4% of covered securities.[25] The Staff also found that for a low volatility period, covering January 1, 2004 to December 31, 2006, the 10% trigger level of Rule 201 would have, on an average day, been triggered for approximately 1.3% of covered securities.[26]

Thus, Rule 201 is structured so that the circuit breaker generally will not be triggered for the majority of covered securities at any given time and, thereby, will not interfere with the smooth functioning of the markets for those securities, including when prices in such securities are undergoing minimal downward price pressure or are stable or rising. If the short sale price test restrictions of Rule 201 apply to a covered security it will be because and when that security is undergoing significant downward price pressure.

In addition, to help ensure the Rule's workability, we are amending Rule 200(g) of Regulation SHO, substantially as proposed, to provide that, once the circuit breaker has been triggered for a covered security, if a broker-dealer chooses to rely on its own determination that

SEC_OEA_FCIC_001391

it is submitting a short sale order to a trading center at a price that is above the current national best bid at the time of submission or to rely on an exception specified in the Rule, it must mark the order "short exempt."[27] The short sale price test restrictions of Rule 201 generally will apply to a small number of securities for a limited duration, and will continue to permit short selling rather than, for example, halting short selling when the restrictions are in place. As such, we believe that the circumstances under which a broker-dealer may need to mark a short sale order "short exempt" under Rule 201 are limited.

II. Background on Short Sale Restrictions

Short selling involves a sale of a security that the seller does not own or a sale that is consummated by the delivery of a security borrowed by, or for the account of, the seller.[28] In order to deliver the security to the purchaser, the short seller will borrow the security, usually from a broker-dealer or an institutional investor. Typically, the short seller later closes out the position by purchasing equivalent securities on the open market and returning the security to the lender. In general, short selling is used to profit from an expected downward price movement, to provide liquidity in response to unanticipated demand, or to hedge the risk of an economic long position in the same security or in a related security.[29]

---

[27] We note that, as discussed in more detail below, unless a sale order is marked "short exempt," a trading center's policies and procedures must be reasonably designed to prevent the execution or display of the order at a price that is less than or equal to the current national best bid.

[28] See 17 CFR 242.200(a).

[29] See, e.g., Exchange Act Release No. 54891 (Dec. 7, 2006), 71 FR 75068, 75069 (Dec. 13, 2006) ("2006 Price Test Elimination Proposing Release"); 2003 Regulation SHO Proposing Release, 68 FR at 62974. In this adopting release, we use the terms "liquidity provider" and "liquidity taker," and correlative terms, in their technical sense in the literature of market microstructure. See, e.g., Larry Harris, Trading and Exchanges: Market Microstructure for Practitioners, at 70 (2003) (an introductory textbook to the economics of market microstructure). As used therein, a liquidity taker is a buyer or seller (including a short seller) who submits an order designed for immediate execution, such as a market order or a marketable limit order, while a liquidity provider is a more patient buyer or seller (including a short seller) who submits orders that may or may not be executed, and thus provides depth to the market. This usage differs from the usage of the term "liquidity provider" to refer to a bank, central bank, or other financial institution or investor who provides cash financing or otherwise increases the money supply.

SEC_OEA_FCIC_001392

A. Short Selling and its Market Impact

Short selling provides the market with important benefits, including market liquidity and pricing efficiency.[30] Market liquidity is often provided through short selling by market professionals, such as market makers (including specialists) and block positioners, who offset temporary imbalances in the buying and selling interest for securities. Short sales effected in the market add to the selling interest of stock available to purchasers and reduce the risk that the price paid by investors is artificially high because of a temporary imbalance between buying and selling interest. Short sellers covering their sales also may add to the buying interest of stock available to sellers.[31]

Short selling also can contribute to the pricing efficiency of the equities markets.[32] When a short seller speculates or hedges against a downward movement in a security, his transaction is a mirror image of the person who purchases the security in anticipation that the security's price will rise or to hedge against such an increase. Both the purchaser and the short seller hope to profit, or hedge against loss, by buying the security at one price and selling at a higher price. The strategies primarily differ in the sequence of transactions. Market participants who believe a stock is overvalued may engage in short sales in an attempt to profit from a perceived divergence of prices from true economic values. Such short sellers add to stock pricing efficiency because

32 See id.

SEC_OEA_FCIC_001393

their transactions inform the market of their evaluation of future stock price performance. This evaluation is reflected in the resulting market price of the security.[33]

Although short selling serves useful market purposes, it also may be used to drive down the price of a security or as a tool to accelerate a declining market in a security.[34] In addition, short selling may be used to illegally manipulate stock prices.[35] One example is the "bear raid" where an equity security is sold short in an effort to drive down the price of the security by creating an imbalance of sell-side interest.[36] This unrestricted short selling could exacerbate a declining market in a security by increasing pressure from the sell-side, eliminating bids, and causing a further reduction in the price of a security by creating an appearance that the security's price is falling for fundamental reasons, when the decline, or the speed of the decline, is being driven by other factors.[37]

---

[33] See 2006 Price Test Elimination Proposing Release, 71 FR at 75069 – 75070; 2003 Regulation SHO Proposing Reelease, 68 FR at 62974. Arbitrageurs also contribute to pricing efficiency by utilizing short sales to profit from price disparities between a stock and a derivative security, such as a convertible security or an option on that stock. For example, an arbitrageur may purchase a convertible security and sell the underlying stock short to profit from a current price differential between two economically similar positions. See id.

[34] See, e.g., Proposal, 74 FR at 18065 (noting that a short selling circuit breaker rule would be designed to target only those securities that experience rapid severe intra-day price declines and, therefore, might help to prevent short selling from being used to drive the price of a security down or to accelerate the decline in the price of those securities).

[35] See, e.g., U.S. v. Russo, 74 F.3d 1383, 1392 (2d Cir. 1996) (short sales were sufficiently connected to the manipulation scheme as to constitute a violation of Exchange Act Section 10(b) and Rule 10b-5); S.E.C. v. Gardiner, 48 S.E.C. Docket 811, No. 91 Civ. 2091 (S.D.N.Y. Mar. 27, 1991) (alleged manipulation by sales representative by directing or inducing customers to sell stock short in order to depress its price).

[36] Many people blamed "bear raids" for the 1929 stock market crash and the market's prolonged inability to recover from the crash. See, e.g., Steve Thel, $850,000 in Six Minutes – The Mechanics of Securities Manipulation, 79 Cornell L. Rev. 219, 295-296 (1994); Jonathan R. Macey, Mark Mitchell & Jeffry Netter, Restrictions on Short Sales: An Analysis of the Uptick Rule and its Role in View of the October 1987 Stock Market Crash, 74 Cornell L. Rev. 799, 801-802 (1989).

[37] See 2006 Price Test Elimination Proposing Release, 71 FR at 75070; 2003 Regulation SHO Proposing Release, 68 FR at 62974.

SEC_OEA_FCIC_001394

B. History of Short Sale Price Test Restrictions in the U.S.

Section 10(a) of the Exchange Act[38] gives the Commission plenary authority to regulate short sales of securities registered on a national securities exchange, as necessary or appropriate in the public interest or for the protection of investors.[39] After conducting an inquiry into the effects of concentrated short selling during the market break of 1937,[40] the Commission adopted former Rule 10a-1 in 1938 to restrict short selling in a declining market.[41]

The core provisions of former Rule 10a-1 remained virtually unchanged for almost seventy years. Over the years, however, in response to changes in the securities markets, including changes in trading strategies and systems used in the marketplace, the Commission added exceptions to former Rule 10a-1 and granted numerous written requests for relief from the Rule's restrictions. These market changes included decimalization, the increased use of matching systems that execute trades at independently-derived prices during random times within specific time intervals,[42] and the spread of fully automated markets. In addition, market

38 15 U.S.C. 78j(a).

39 See id.; see also 2006 Price Test Elimination Proposing Release, 71 FR at 75068; 2003 Regulation SHO Proposing Release, 68 FR at 62973.

40 The study covered two weekly periods, that of September 7-13, 1937, and that of October 18-23, 1937. See Exchange Act Release No. 1548 (Jan. 24, 1938), 3 FR 213 (Jan. 26, 1938) ("Former Rule 10a-1 Adopting Release").

41 See id. Former Rule 10a-1 provided that, subject to certain exceptions, a listed security could be sold short (i) at a price above the price at which the immediately preceding sale was effected (plus tick), or (ii) at the last sale price if it was higher than the last different price (zero plus tick).

42 See, e.g., letter from Larry E. Bergmann, Senior Associate Director, Division of Market Regulation, SEC, to Andre E. Owens, Schiff Hardin & Waite, dated Apr. 23, 2003 (granting exemptive relief from former Rule 10a-1 for trades executed through an alternative trading system ("ATS") that matches buying and selling interest among institutional investors and broker-dealers at various set times during the day).

SEC_OEA_FCIC_001395

developments over the years led to the application of different price tests to securities trading in different markets.[43]

In July 2004, the Commission adopted Rule 202T of Regulation SHO,[44] which established procedures for the Commission to temporarily suspend short sale price tests for a prescribed set of securities so that the Commission could study the effectiveness of these tests.[45] Pursuant to the process established in Rule 202T, the Commission issued an order creating the Pilot, which temporarily suspended the tick test of former Rule 10a-1 and any price test of any national securities exchange or national securities association for short sales of certain securities.[46] The Pilot was designed to assist the Commission in assessing whether changes to short sale price test regulation were appropriate at that time in light of then-current market practices and the purposes underlying short sale price test regulation.[47]

---

[43] See, e.g., Exchange Act Release No. 55245 (Feb. 5, 2007), 72 FR 6635 (Feb. 12, 2007). Former Rule 10a-1 applied only to short sale transactions in exchange-listed securities. In 1994, the Commission granted temporary approval to NASD to apply its own short sale rule, known as the "bid test," on a pilot basis that was renewed annually until the Commission repealed short sale price tests. NASD's former bid test prohibited short sales in Nasdaq Global Market securities (then known as Nasdaq National Market securities) at or below the current (inside) bid when the current best (inside) bid was below the previous best (inside) bid in a security. As a result, until the Commission eliminated former Rule 10a-1, and prohibited any SRO from having a short sale price test in July 2007, Nasdaq Global Market securities traded on Nasdaq or the over-the-counter ("OTC") market and reported to a NASD facility were subject to a bid test. Nasdaq securities traded on exchanges other than Nasdaq were not subject to any price test. In addition, many thinly-traded securities, such as Nasdaq Capital Market securities and securities quoted on the OTC Bulletin Board and Pink Sheets, were not subject to any price test wherever traded. According to the Staff, in 2005, prior to the start of the Pilot, NASD's former bid test applied to approximately 2,800 securities, while former Rule 10a-1 applied to approximately 4,000 securities.

[44] 17 CFR 242.202T.

[45] See 17 CFR 242.202T; see also 2004 Regulation SHO Adopting Release, 69 FR at 48012-48013.

[46] See Pilot Release, 69 FR 48032.

[47] See id. In the 2004 Regulation SHO Adopting Release, we noted that "the purpose of the [P]ilot is to assist the Commission in considering alternatives, such as: (1) Eliminating a Commission-mandated price test for an appropriate group of securities, which may be all securities; (2) adopting a uniform bid test, and any exceptions, with the possibility of extending a uniform bid test to securities for which there is currently no price test; or (3) leaving in place the current price tests." 2004 Regulation SHO Adopting Release, 69 FR at 48010.

SEC_OEA_FCIC_001396

The Staff gathered the data made public during the Pilot, analyzed the data and provided the Commission with a summary report on the Pilot ("Staff's Summary Pilot Report").[48] The Staff's Summary Pilot Report, which was made public, examined several aspects of market quality including the overall effect of then-current price tests on short selling, liquidity, volatility and price efficiency.[49] The Pilot was also designed to allow the Commission and members of the public to examine whether the effects of the then-current short sale price tests were similar across stocks.[50]

As set forth in the Staff's Summary Pilot Report, the Staff found little empirical justification at that time for maintaining then-current short sale price test restrictions, especially for actively traded securities. Amongst its results, the Staff found that such short sale price tests did not have a significant impact on daily volatility. However, the Staff also found some evidence that the short sale price tests dampened intra-day volatility for smaller stocks.[51]

In addition, the Staff found that the Pilot data provided limited evidence that then-current price test restrictions distorted a security's price.[52] The Staff also found that the price test

---

[48] See http://www.sec.gov/about/economic/shopilot091506/draft_reg_sho_pilot_report.pdf and http://www.sec.gov/news/studies/2007/regshopilot020607.pdf.

[49] See Staff's Summary Pilot Report at 40-47; see also id. at 22-24 (discussing the selection of securities included in the Pilot and the control group).

[50] In the 2004 Regulation SHO Adopting Release, the Commission stated its expectation that data on trading during the Pilot would be made available to the public to encourage independent researchers to study the Pilot. See 2004 Regulation SHO Adopting Release, 69 FR at 48009, n.9. Accordingly, nine SROs began publicly releasing transactional short selling data on Jan. 3, 2005. The nine SROs at that time were the Amex, ARCA, BSE, CHX, NASD, Nasdaq, National Stock Exchange, NYSE and Phlx. The SROs agreed to collect and make publicly available trading data on each executed short sale involving equity securities reported by the SRO to a securities information processor ("SIP"). The SROs published the information on a monthly basis on their Internet Web sites.

[51] See Staff's Summary Pilot Report at 55-56.

[52] On the day the Pilot went into effect, listed Pilot securities underperformed listed control group securities by approximately 24 basis points. The Pilot and control group securities, however, had similar returns over the first six months of the Pilot. See Staff's Summary Pilot Report at 8.

SEC_OEA_FCIC_001397

restrictions resulted in an increase in quote depths.[53] Realized liquidity levels, however, were unaffected by the removal of such short sale price test restrictions.[54] The Pilot data also provided evidence that the short sale price test restrictions reduced the volume of executed short sales to total volume and, therefore, acted as a constraint on short selling.[55] The Staff did not find, however, a significant difference in short interest positions between those securities subject to a short sale price test versus those securities that were not subject to such a test during the Pilot.[56]

In addition, the Commission encouraged outside researchers to examine the Pilot data. In response to this request, the Commission received four completed studies (the "Academic Studies") from outside researchers that specifically examined the Pilot data.[57] The Commission also held the Regulation SHO 2006 Roundtable[58] that focused on the empirical evidence learned from the Pilot data (the Staff's Summary Pilot Report, Academic Studies, and Regulation SHO 2006 Roundtable are referred to collectively herein as the "Pilot Results").[59] The Pilot Results contained a variety of observations, which the Commission considered in determining whether or not to propose removal of then-current short sale price test restrictions and subsequently whether

---

53 See Staff's Summary Pilot Report at 55.

54 This conclusion is based on the result that changes in effective spreads were not economically significant (less than a basis point) and that the changes in the bid and ask depth appear not to affect the transaction costs paid by investors. Arguably, the changes in bid and ask depth appeared to affect the intra-day volatility. However, the Staff concluded that overall, the Pilot data did not suggest a deleterious impact on market quality or liquidity. See Staff's Summary Pilot Report at 40-42, 55.

55 See Staff's Summary Pilot Report at 35.

56 See id.

SEC_OEA_FCIC_001398

or not to eliminate such restrictions. For example, one study concluded that former Rule 10a-1 had little or no effect on price efficiency.[60] Another study found no evidence that former Rule 10a-1 negatively impacted price discovery.[61]

Generally, the Pilot Results supported removal of the short sale price test restrictions that were in effect at that time.[62] In addition to the Pilot Results, thirteen other analyses by SEC staff and various third party researchers were conducted between 1963 and 2004 addressing price test restrictions.[63] Among these were several studies that evaluated short sale price tests during times of significant market decline, including the market break of May 28, 1962, the market decline of September and October 1976, the market break of October 19, 1987, and the Nasdaq market decline of 2000-2001. The results of these studies were mixed, but generally the studies found that former Rule 10a-1 did not prevent short sales in extreme down markets and did limit short selling in up markets, and the studies provided additional support for the removal of the permanent, market-wide short sale price test restrictions in existence at that time.

In December 2006, the Commission proposed to eliminate former Rule 10a-1 by removing restrictions on the execution prices of short sales, as well as prohibiting any SRO from having a short sale price test.[64] The Commission received twenty-seven comment letters in response to its proposal to eliminate former Rule 10a-1 and prohibit any SRO from having a short sale price test. The comments in response to the proposed amendments varied. Most commenters (including individual traders, an academic, broker-dealers, SROs and trade

associations) advocated removing all short sale price test restrictions.[65] Generally, these commenters believed that short sale price test restrictions were no longer necessary due to increased market transparency and the existence of real-time regulatory surveillance that could monitor for and detect any potential short sale manipulation.[66]

Two commenters (both individual investors) opposed the proposed amendments, noting the need for short sale price tests to prevent "bear raids."[67] One commenter, although generally in support of removing all short sale price test restrictions, stated the belief that at some level unrestricted short selling should be collared.[68] This commenter supported having a 10% circuit breaker to prevent panic in the event there is a major market collapse.[69] The New York Stock Exchange ("NYSE") also noted its concern about unrestricted short selling during periods of unusually rapid and large market declines. The NYSE stated that the effects of an unusually

rapid and large market decline could not be measured or analyzed during the Pilot because such decline did not occur during the period studied.[70]

Effective July 3, 2007, the Commission eliminated former Rule 10a-1 and added Rule 201 of Regulation SHO, prohibiting any SRO from having a short sale price test.[71] The Commission stated that it determined to eliminate all short sale price test restrictions after reviewing the comments received in response to its proposal to eliminate all short sale price test restrictions, reviewing the Pilot Results, and taking into account the market developments that had occurred in the securities industry since the Commission adopted former Rule 10a-1 in 1938.[72] In addition, the Commission stated its belief that the amendments would bring increased uniformity to short sale regulation, level the playing field for market participants, and remove an opportunity for regulatory arbitrage.[73]

C. Proposal to Adopt a Short Sale Price Test Restriction or Circuit Breaker

On April 8, 2009, following changes in market conditions since the elimination of former Rule 10a-1, we proposed to re-examine and seek comment on whether to impose price test restrictions or circuit breaker restrictions on short selling.[74] In the Proposal, we noted that market volatility had recently increased markedly in the U.S., as well as in every major stock market around the world.[75] We also noted that although we were not aware of specific empirical evidence that the elimination of short sale price tests contributed to the increased volatility in

U.S. markets, many members of the public associate the removal of former Rule 10a-1 with such volatility, including steep declines in some securities' prices, and loss of investor confidence in our markets.[76] Due to the market conditions with which we were faced and the resulting deterioration in investor confidence, we stated in the Proposal that we believed it was appropriate to propose amending Regulation SHO to add a short sale price test or a circuit breaker rule.[77]

In response to the Proposal and the Re-Opening Release, we received over 4,300 unique comment letters.[78] A number of commenters stated that they do not believe that we should reinstate any form of short sale price test restriction, whether in the form of a short sale price test restriction or a circuit breaker rule. For example, a number of commenters noted a lack of empirical evidence suggesting that such restrictions would advance the Commission's goals of restoring investor confidence and preventing short selling, including potentially abusive or manipulative short selling, from driving down the market or being used as a tool to exacerbate a declining market in a security.[79] In response to our specific request for empirical data in the

SEC_OEA_FCIC_001403

segment of the overall equity marketplace and active short sellers are an even smaller group of participants and, therefore, represented a de minimus amount of the selling pressure that the markets experienced recently.[82] As support for their arguments, commenters referenced, among other things, two recent studies by the Staff that were also discussed in the Proposal.[83] In these studies, the Staff analyzed the impact that a short sale price test might have had during a thirteen day period in September 2008,[84] as well as whether and the extent to which short selling and long selling exerted downward price pressure during a volatile period in early September 2008.[85] The first of these studies noted that, although its data was limited to historical trade and quote data from a period when no short sale price test was in place and the shape of order book and trading sequences might have differed had a short sale price test been in place, a short sale price test would likely have been most restrictive during periods of low volatility, with greatest impact on short selling in lower priced and more active stocks.[86] The second study found that during periods of price declines, the selling pressure was more intense from long sellers than from short sellers. It also found that, on average, short sale volume as a fraction of total volume was highest during periods of positive returns, noting, however, that it was also possible that there were instances in which short selling activity peaked during periods of extreme negative returns.[87]

Some commenters stated that the recent market stability suggests that investor confidence has been restored and, therefore, short sale price test restrictions are not necessary.[88] Several commenters submitted data or referenced studies showing that investor confidence has recently improved.[89] A number of commenters expressed concern that any short sale price test restriction would carry with it the unintended consequences of reduced liquidity and widened bid-ask spreads, resulting in less efficient pricing in the securities markets.[90] One commenter stated its belief that because short sale price test restrictions would weaken and erode benefits of short selling such as liquidity, price discovery and the ability to manage risk, they would also weaken and erode investor confidence.[91] Many commenters stated that the reinstatement of any short sale price test restriction would impose significant costs on market participants and lead to increased transaction costs for investors.[92] In addition, several commenters noted that while the

Commission is rightly trying to increase investor confidence, current short sale regulations, including Rule 204 of Regulation SHO and Exchange Act Rule 10b-21, are sufficient to address the public's concerns about potentially abusive short selling.[93]

A significant number of commenters, however, continue to urge the Commission to reinstate some form of short sale price test restriction because these commenters believe that such a measure will help to restore investor confidence.[94] One commenter stated that "we

Corporation, dated June 19, 2009 ("Sears"); letter from Glen Shipway, dated Sept. 21, 2009 ("Glen Shipway (Sept. 2009)"). In addition, the American Bankers Association noted that its members, "both large and small, have told us that short sellers were taking advantage of the uptick rule's absence; that their stock prices were experiencing excessive downward pressure unrelated to actual conditions of the firm . . . ." and that its members expressed "that measures needed to be taken, including reinstating the uptick rule in some format, to reduce the avenues for abusive trading practices and to restore investor confidence." Letter from Sarah A. Miller, Senior Vice President, Center for Securities, Trust and Investments, American Bankers Association, dated July 1, 2009 ("Amer. Bankers Assoc."); see also letter from Paul Tudor Jones II, Tudor Investment Corporation, dated Oct. 10, 2008 (stating that he believes that one way to "immediately stem the decline" in the stock market would be to reinstate the uptick rule); letter from James F. Kane, Jr., dated Feb. 6, 2009 (stating that he believes that reinstating "the Up-tick Rule will go a long way in preventing speculators from ganging up on a particular stock and forcing it down"); letter from Briggs Diuguid (stating that while short sellers "make efficient markets," he is nonetheless concerned that short selling may be a tool of manipulators when short sales are "piled on" a particular company).

[99] See e.g., letter to Mary Schapiro, Chairman, from Kirsten Gillibrand, United States Senator, dated June 5, 2009; joint statement of Ted Kaufman, United States Senator, and Johnny Isakson, United States Senator, dated Sept. 29, 2009. In addition, prior to (and as cited in) the Proposal, several current and former Members of Congress have called for reinstatement of short sale price test restrictions. See, e.g., letter to Christopher Cox, Chairman, from Hillary Rodham Clinton, former United States Senator, dated Sept. 17, 2008; letter to Christopher Cox, Chairman, from Bill Sali, Member of Congress, dated Oct. 1, 2008; letter to Christopher Cox, Chairman, from Peter T. King, Member of Congress, dated Oct. 7, 2008; letter to Mary Schapiro, Chairman, from Gary L. Ackerman, Member of Congress, dated Jan. 27, 2009; letter to Mary Schapiro, Chairman, from Rep. Barney Frank and other Members of the House Financial Services Committee, dated Mar. 11, 2009; Proposal, 74 FR at 18046-18047 (noting statements by a Member of Congress and a former U.S. Senator asking the Commission to reinstate former Rule 10a-1 or some other form of short sale price test restriction). See also letter to Mary Schapiro, Chairman, from Carolyn Maloney, Member of Congress and Chairman of the Joint Economic Committee, dated Mar. 23, 2009. We note, however, that other Members of Congress have expressed concerns regarding our adopting a short sale price test restriction. See, e.g., letter to Mary Schapiro, Chairman, from Michael Crapo, United States Senator, Jim Bunning, United States Senator, David Vitter, United States Senator, Michael Enzi, United States Senator, and Mel Martinez, former United States Senator, dated June 17, 2009.

With respect to comments by SRO representatives, see, e.g., letter from Janet M. Kissane, Senior Vice President, Legal and Corporate Secretary, NYSE Euronext, dated Sept. 21, 2009 ("NYSE Euronext (Sept. 2009)"); letter from NYSE Euronext (June 2009); statement of Larry Leibowitz, Group Executive Vice President and Head of Global Technology and US Executions, NYSE Euronext, dated May 5, 2009 ("NYSE Euronext (May 2009)"). In addition, prior to (and as cited in) the Proposal, one senior SRO representative endorsed the reinstatement of a short sale price test restriction. See Edgar Ortega, Short-Sale Rule Undermined as Bernanke Backs Review, Bloomberg News Service, Mar. 4, 2009 (noting comments by Duncan Niederauer, CEO, The NYSE Euronext Group, Inc., that imposing a measure such as former Rule 10a-1, "would go a long way to adding confidence" in our markets).

[100] See letter from NYSE Euronext (June 2009).

SEC_OEA_FCIC_001408

downturn and the elimination of former Rule 10a-1.[101] Commenters also submitted data or referenced studies they believe support the contention that a price test restriction would have a positive impact on the market.[102] In addition, there have been reports of significant short selling in connection with the use of credit default swaps ("CDS"), particularly in the securities of significant financial institutions,[103] and it has been suggested that the interaction between and amplifying effects of CDS and short selling may be a reason to reinstate a short sale price test.[104]

Further, as we stated in the Proposal, questions and comments have been raised about the role that short selling, and in particular potentially abusive short selling, may have had in connection with the recent price fluctuations and disruption in our markets.[105] As such, prior to issuing the Proposal, in the latter part of 2008, we took a number of other short sale-related actions aimed at addressing these concerns. For example, due to our concerns that false rumors spread by short sellers regarding financial institutions of significance in the U.S. may have fueled market volatility in the securities of some of these institutions, on July 15, 2008, we issued an

SEC_OEA_FCIC_001409

emergency order ("July Emergency Order")[106] pursuant to Section 12(k)(2) of the Exchange Act[107] which imposed borrowing and delivery requirements on short sales of the equity securities of certain financial institutions. We noted in the July Emergency Order that false rumors can lead to a loss of investor confidence. Such loss of investor confidence can lead to panic selling, which may be further exacerbated by "naked" short selling. As a result, the prices of securities may artificially and unnecessarily decline well below the price level that would have resulted from the normal price discovery process.[108] If significant financial institutions are involved, this chain of events can threaten disruption of our markets.[109]

Due to our concerns regarding the impact of short selling on the prices of financial institution securities, on September 18, 2008, we issued another emergency order prohibiting short selling in the publicly traded securities of certain financial institutions.[110] Our concerns, however, were not limited to financial institutions, given the importance of confidence in our markets and the rapid and steep declines in the prices of securities that generally we were seeing at that time.[111] Such rapid and steep price declines can give rise to questions about the underlying financial condition of an institution, which in turn can erode confidence, even without

SEC_OEA_FCIC_001410

an underlying fundamental basis.[112] This erosion of confidence can impair the liquidity and ultimate viability of an institution, with potentially broad market consequences.[113]

These concerns resulted in our issuance on September 17, 2008 of an emergency order under Section 12(k)(2) of the Exchange Act, in part targeting short selling in all equity securities.[114] Pursuant to the September Emergency Order we imposed enhanced delivery requirements on sales of all equity securities under Rule 204T of Regulation SHO.[115]

Rule 204T, among other things, required participants of a registered clearing agency to close-out fails to deliver resulting from short sales of any equity security by purchasing or borrowing the security by no later than the beginning of trading on the day after the fail to deliver occurred. We adopted the provisions of the September Emergency Order as an Interim Final Temporary Rule in October 2008 because of our continued concern about the potentially negative market impact of large and persistent fails to deliver.[116]

Our adoption of Interim Final Temporary Rule 204T followed a series of other steps aimed at reducing such fails to deliver and addressing potentially abusive short selling. These steps included eliminating the "grandfather" and options market maker exceptions to Regulation SHO's close-out requirement,[117] and proposing and subsequently adopting a "naked" short

---

[112] See Short Sale Ban Emergency Order, 73 FR 55169; September Emergency Order, 73 FR 54875.

[113] See id.

[114] See September Emergency Order, 73 FR 54875.

[115] See id. In addition, we issued an emergency order, and subsequent Interim Final Temporary Rule, Rule 10a-3T, to require disclosure of short sales and short positions in certain securities. The temporary rule expired on August 1, 2009. See Exchange Act Release No 58591 (Sept. 18, 2008) 73 FR 55175 (Sept. 24, 2008); Exchange Act Release No. 58785 (Oct. 15, 2008), 73 FR 61678 (Oct. 17, 2008).

[117] See Exchange Act Release No. 56212 (Aug. 7, 2007), 72 FR 45544 (Aug. 14, 2007) (eliminating the "grandfather" exception to Regulation SHO's close-out requirement); September Emergency Order, 73 FR 54875 (eliminating the options market maker exception to Regulation SHO's close-out requirement).

SEC_OEA_FCIC_001411

selling anti-fraud rule, Rule 10b-21.[118] Although we recognize that fails to deliver can occur for legitimate reasons, we remained concerned about the impact of large and persistent fails to deliver on market confidence. Results from Staff analysis indicate that our actions to further reduce fails to deliver are having their intended effect. For example, these results indicate that fails to deliver in all equity securities have declined significantly since the adoption of Interim Final Temporary Rule 204T.[119] To help further our goal of reducing fails to deliver by maintaining the reductions in fails to deliver achieved by the adoption of Interim Final Temporary Rule 204T, as well as other actions taken by the Commission, we adopted the substance of Interim Final Temporary Rule 204T as a permanent rule, Rule 204, in July 2009.[120]

Despite the significant decline in fails to deliver and the more recent stability in the securities markets, concerns persist about rapid and steep price declines in securities and erosion of investor confidence in our markets. Thus, we continued to examine whether there are other actions that the Commission should take, including re-evaluating whether a short sale price test should be reintroduced or a circuit breaker rule should be imposed.

As we stated in the Proposal, when we eliminated all short sale price test restrictions in July 2007, we acknowledged that circumstances may develop that could warrant relief from the

---

Following the issuance of the September Emergency Order, we adopted amendments making permanent the elimination of the options market maker exception. See Exchange Act Release No. 58775 (Oct. 14, 2008), 73 FR 61690 (Oct. 17, 2008) ("Options Market Maker Elimination Release").

[118] See Exchange Act Release No. 58774 (Oct. 14, 2008), 73 FR 61666 (Oct. 17, 2008); September Emergency Order, 73 FR 54875; Exchange Act Release No. 57511 (Mar. 17, 2008), 73 FR 15376 (Mar. 21, 2008).

[119] See Memorandum from the Staff Re: Impact of Recent SHO Rule Changes on Fails to Deliver, Nov. 4, 2009 at http://www.sec.gov/spotlight/shortsales/oeamemo110409.pdf (stating, among other things, that the average daily number of aggregate fails to deliver for all securities decreased from 2.21 billion to 0.25 billion for a total decline of 88.5% when comparing a pre-Rule to post-Rule period); Memorandum from the Staff Re: Impact of Recent SHO Rule Changes on Fails to Deliver, Nov. 26, 2008 at http://www.sec.gov/comments/s7-30-08/s73008-37.pdf; Memorandum from the Staff Re: Impact of Recent SHO Rule Changes on Fails to Deliver, Mar. 20, 2009 at http://www.sec.gov/comments/s7-30-08/s73008-107.pdf.

[120] See Exchange Act Release No. 60388 (July 27, 2009), 74 FR 38266 (July 31, 2009) ("Rule 204 Adopting Release"). Rule 204 contained some modifications to address commenters' concerns. See id.

SEC_OEA_FCIC_001412

prohibition in Rule 201 of Regulation SHO for a short sale price test, including a short sale price test of an SRO, to apply to short sales in any security.[121] Thus, in determining whether or not to propose, and now adopt, a short sale price test rule or circuit breaker rule, we have considered the recent turmoil in the financial sector and steep declines and extreme volatility in securities prices.[122]

As discussed in this adopting release, we remain mindful that short selling provides benefits to the market. For example, legitimate short selling can play an important and constructive functional role in the markets, providing liquidity and price efficiency. Short sellers also play an important role in correcting upward stock price manipulation.[123] Because short sale price test restrictions may lessen some of these benefits, it is important that any short sale price test regulation is designed to limit any potentially unnecessary impact on legitimate short selling.

Thus, as discussed in detail below, we are adopting in Rule 201 a targeted short sale price test restriction that will be based on the current national best bid and that will apply only if the price of an individual security declines intra-day by 10% or more from that security's prior day's closing price on the listing market for that security. We are also amending Rule 200(g) of Regulation SHO to address when a broker-dealer may need to mark certain sell orders "short exempt."

D. Empirical Data Regarding Potential Market Impact of Short Sale Price Test Restrictions Submitted in Response to the Proposal and Re-Opening Release

In the Proposal, we requested that commenters provide empirical data to support their views and arguments with respect to the proposed short sale price test rules and the proposed

---

[121] See Proposal, 74 FR at 18048; see also 2007 Price Test Adopting Release, 72 FR at 36348.

[122] See, e.g., Proposal, 74 FR at 18048 (noting the turbulence in the securities markets at the time we issued the Proposal and during the eighteen months prior thereto).

[123] See, e.g., Staff's Summary Pilot Report at 9.

SEC_OEA_FCIC_001413

circuit breaker rules.[124] Overall, the interpretations and results of the analyses submitted were mixed and sometimes conflicted with each other. In addition, the methods used in the empirical analyses submitted ranged from simple plots of data points to carefully constructed econometrics. The Pilot Results, while dated, in our view should continue to inform our decision-making where relevant, and none of the empirical studies discussed below have given us reason to question the rigor or validity of the Pilot Results.

A number of commenters submitted data or referenced studies in support of their position that a short sale price test restriction would not have a positive impact on the market.[125] In contrast, and as we noted in the Proposal, some commenters have indicated that they believe that they have collected data that establishes a possible association between the recent market downturn and the elimination of former Rule 10a-1.[126] Commenters also submitted data or referenced studies in support of the contention that a price test restriction would have a positive

SEC_OEA_FCIC_001414

impact on the market.[127] We summarize below findings from these studies and discuss our views with respect to the studies.

Several commenters cited empirical evidence showing that short selling contributes to market liquidity, price discovery, and market efficiency and that restrictions on short selling, particularly bans on short selling, may impede liquidity, price discovery, and market efficiency.[128] While we agree with commenters that short selling contributes to market liquidity, price discovery and market efficiency and while these studies provide relevant information with respect to the effects of a short selling ban, they do not address the effects of a short sale price test restriction, or more specifically for purposes of Rule 201, a circuit breaker that, when triggered, imposes the alternative uptick rule.[129] In fact, because Rule 201 does not impose a ban

(June 2009) (referencing Lawrence E. Harris, Ethan Namvar and Blake Phillips, Price Inflation and Wealth Transfer during the 2008 SEC Short-Sale Ban, (Apr. 2009)); Matthew Clifton and Mark Snape, The Effect of Short-selling Restrictions on Liquidity: Evidence from the London Stock Exchange (Dec. 19, 2008); Recent Trends in Trading Activity, Short Sales and Failed Trades and Study on the Impact of the Prohibition on the Short Sale of Inter-Listed Financial Sector Issuers by Investment Industry Regulatory Organization of Canada (IIROC) (February 2009); See Autore, Billingsley, and Kovacs, Short Sale Constraints, Dispersion of Opinion, and Market Quality: Evidence from the Short Sale Ban on U.S. Financial Stocks (June 19, 2009); memorandum regarding meeting with Credit Suisse (July 2009); see also letter from Credit Suisse (Mar. 2009).

[129] See id. In addition, several commenters cited research showing that short selling may be beneficial to price discovery and market efficiency, but that did not address the effect of a short sale price test restriction on price discovery or market efficiency. See letter from CPIC (June 2009) (citing Jonathan Karpoff and Xiaoxia Lou, Do Short Sellers Detect Overpriced Firms? Evidence from SEC Enforcement Actions, Working paper, 2008); letter from Goldman Sachs (Sept. 2009) (citing Jonathan Karpoff and Xiaoxia Lou, Short Sellers and Financial Misconduct, Working paper, 2009); letter from Pershing Square (citing Jonathan Karpoff and Xiaoxia Lou, Do Short Sellers Detect Overpriced Firms? Evidence from SEC Enforcement Actions, Working paper, 2008); letter from CPIC (Sept. 2009) (citing Jonathan Karpoff and Xiaoxia Lou, Short Sellers and Financial Misconduct, Working paper, 2009). Another commenter submitted a study showing that short sellers trade after news stories

SEC_OEA_FCIC_001415

on short selling but instead continues to allow short selling (although at a price above the national best bid) when the short sale price test restriction has been triggered, the Rule's structure will help preserve the benefits of short selling.

Some commenters cited a study (the "Pre-Borrow Study") which did not find a relationship between changes in short interest and changes in trading volume, and which concluded that "short sales do not have a significant effect on market liquidity: Other factors drive liquidity."[130] We note, however, that the correlation between changes in short interest and changes in trading volume may not be an accurate measure of the impact of short sales on liquidity. Economic theory does not tend to support using changes in trading volume as a measure of liquidity.[131] Trading volume itself, as opposed to changes in trading volume, is considered a measure of liquidity, though other measures, such as effective spreads and price impact, are considered by many to be better measures of liquidity and are more commonly used for measuring the liquidity of equities.[132] In addition, changes in short interest do not necessarily measure the volume of short selling. In fact, short interest is a "snapshot" variable, so the change

---

and that short sellers effectively process publicly available information. See letter from Prof. Reed. While this study uses short selling volume data to support its conclusion that short sellers do not disproportionately engage in information-based manipulation, it does not directly examine the impact of a short sale price test restriction, and, therefore, has limited utility for purposes of evaluating the potential market impact of Rule 201.

130 See, e.g., letter from Patrick M. Byrne, Chairman and CEO, Overstock.com, Inc., dated May 29, 2009 ("Overstock.com (May 2009)") (citing Robert J. Shapiro and Nam D. Pham, The Impact of a Pre-Borrow Requirement for Short Sales on Failures-to-Deliver and Market Liquidity, Apr. 2009; letter from Brian D. Pardo, Chairman and CEO, Life Partners Holding, Inc., dated May 28, 2009 ("Life Partners Holding") (citing the Pre-Borrow Study).

131 The reason why we cannot interpret a change in trading volume as a measure of liquidity can be illustrated by the following example: A less liquid stock can experience an increase (positive change) in trading volume and a more liquid stock can experience a decrease in trading volume. Measuring liquidity by changes in trading volume will mischaracterize the less liquid stock as more liquid and the more liquid stock as less liquid.

132 See, e.g., Tarun Chordia, Richard Roll, and Avanidhar Subrahmanyam, 2001, Market Liquidity and Trading Activity," Journal of Finance, 34: 501-530; Joel Hasbrouck and Duane J. Seppi, 2001, Common Factors in Prices, Order Flows and Liquidity, Journal of Financial Economics, 59: 383-411; Yakov Amihud, 2002, Illiquidity and stock returns: cross-section and time-series effects," Journal of Financial Markets, 5: 31-56.

SEC_OEA_FCIC_001416

in short interest does not necessarily measure correctly the volume of short selling, which is what the Pre-Borrow Study is trying to examine. Thus, we do not believe that the results in the Pre-Borrow Study cited by commenters should be interpreted to suggest that short sales are unimportant for liquidity. We also note that the Pre-Borrow study does not reconcile its results to a large body of conflicting evidence, including (but not restricted to) analyses in the comments mentioned above, showing that short selling contributes to market liquidity and that restrictions on short selling, particularly bans on short selling, may impede liquidity.[133]

Several commenters provided analyses showing that short interest initially fell immediately after the repeal of former Rule 10a-1 and that either short interest or short selling volume fell for specific stocks over periods leading up to the Short Sale Ban Emergency Order.[134] Overall, these analyses show that the negative returns of financial securities in the weeks both before and during the Short Sale Ban Emergency Order are unlikely to be the result of short selling activities.[135] We note that, although these studies create some doubt about whether certain price declines during that time period were caused by short sellers, because the analyses provided are specific to the Short Sale Ban Emergency Order and to a time period during which there was significant market turmoil, the analyses are less relevant regarding the potential impact on returns of the circuit breaker approach of Rule 201.

Several other commenters stated that the absence of a short sale price test restriction has been detrimental to prices and provided information on share prices, volume and/or short interest

---

[133] See supra note 128 (referencing, among others, empirical evidence cited by commenters as showing that short selling contributes to market liquidity).

[134] See, e.g., letter from Dialectic Capital (June 2009); letter from MFA (June 2009); letter from STA (Sept. 2009); Avramovic (Sept. 2008).

[135] See Avramovic (Sept. 2008); letter from Credit Suisse (June 2009).

SEC_OEA_FCIC_001417

that they believe support this statement.[136] We note that, while some of the noted price changes coincide with changes in short selling activity, some do not.[137] Moreover, because these studies look at a long horizon (e.g., months instead of minutes), it is not clear that the evidence provided is relevant to support such conclusion. Thus, it is difficult to conclude from these analyses that the absence of a short sale price test restriction and the actions of short sellers resulted in issuer prices falling below their fundamental values.

One commenter cited a study that used intra-day short selling transaction data to examine the impact of short selling on volatility and found that the removal of former Rule 10a-1 did not exacerbate volatility.[138] We note that, while the study analyzed a period prior to and after the removal of former Rule 10a-1, it analyzed only a six-week period following the elimination of former Rule 10a-1, which may minimize the study's statistical significance. We also note that although the Staff found, in the Staff's Summary Pilot Report presenting the Staff's analysis of the data made public during the Pilot, that short sale price tests in effect at that time did not have a significant impact on daily volatility, the Staff also found some evidence that the short sale price tests dampened intra-day volatility for smaller stocks.[139]

In contrast, other commenters submitted data showing an increase in volatility from July 2007 through November 2008 to support the conclusion that the absence of a short sale price test

---

[136] See, e.g., letter from Park National; letter from GE; letter from Aflac; letter from IBC; letter from Jeff Wang; letter from Martin Napor.

[137] For example, some of the noted price declines coincide with increases in short interest. See letter from Aflac; letter from IBC. Other noted price changes do not correlate with changes in short interest or short selling activity. See letter from Dialectic Capital (June 2009); letter from MFA (June 2009); letter from Peter J. Driscoll, Chairman, John C. Giesea, President and CEO, Security Traders Association, dated June 19, 2009 ("STA (June 2009)"); Avramovic (Sept. 2008).

[139] See Staff's Summary Pilot Report at 55.

SEC_OEA_FCIC_001418

restriction caused an increase in market volatility.[140] As discussed above and in the Proposal,[141] concurrent with the subprime mortgage crises and credit crisis in 2007, U.S. markets experienced increased volatility and steep price declines, particularly in the stocks of certain financial issuers. We are not aware, however, of any empirical evidence that the elimination of short sale price test restrictions contributed to the increased volatility in the U.S. markets. In addition, the data showing an increase in volatility since the elimination of former Rule 10a-1 submitted by commenters in response to the Proposal does not address the extent to which other factors may have influenced the increased volatility. Moreover, because these studies look at a long horizon (e.g., months instead of minutes), it is not clear that the evidence provided is relevant to support such conclusion. Thus, the relationship between the elimination of short sale price test restrictions and the increased volatility remains unclear.

Several commenters submitted data on the percentage of short sales that might be affected by a short sale price test restriction.[142] One commenter submitted data indicating that the alternative uptick rule, adopted on a permanent, market-wide basis, could affect up to 37% of short sale orders.[143] As acknowledged by this commenter, however, this number does not indicate how severely the short sellers would be affected, how the number might change in different market conditions, or whether the number would result in changes in market quality.[144]

---

[140] See, e.g., letter from NAREIT; letter from High Street Advisors; letter from European Investors (June 2009); letter from European Investors (Sept. 2009).

[141] See Proposal, 74 FR at 18043.

[142] See letter from Prof. Jones; letter from BATS (May 2009) (stating that, on its own market during May, June, September and October 2008, 12% to 13% of all executions were short sellers trading at a price less than the last execution price).

[143] See letter from Prof. Jones (stating that, during the period from July 6, 2007 through the end of August 2007, an average of 37% of submitted short sale orders in NYSE-listed Russell 3000 stocks were either market orders or marketable limit orders).

[144] See id.

SEC_OEA_FCIC_001419

In addition, as acknowledged by the commenter, the number also does not account for how order submission strategies would differ based on the alternative uptick rule.[145]

In addition, as discussed in more detail below,[146] in response to our request for comment on an appropriate threshold at which to trigger the proposed circuit breaker short sale price restrictions, commenters submitted estimates of the number of securities that would trigger a circuit breaker rule at a 10% threshold.[147] While commenters' analyses (including the facts and assumptions used) and their resulting estimates varied,[148] commenters' estimates reflect that a 10% circuit breaker threshold, on average, should affect a limited percentage of covered securities.[149] Given the variations in the facts and assumptions underlying the estimates submitted by commenters, the Staff also looked at trading data to confirm the reasonableness of those estimates. The Staff found that, during the period covering April 9, 2001 to September 30, 2009,[150] the price test restrictions of Rule 201 would have been triggered, on an average day, for approximately 4% of covered securities.[151] The Staff also found that for a low volatility period, covering January 1, 2004 to December 31, 2006, the 10% trigger level of Rule 201 would have, on an average day, been triggered for approximately 1.3% of covered securities.[152] Thus, we believe that the short sale price test restriction of Rule 201 is structured so that generally it will not be triggered for the majority of covered securities at any given time and, thereby, will not

SEC_OEA_FCIC_001420

interfere with the provision of market benefits such as liquidity and price efficiency for those securities, including when prices in such securities are undergoing minimal downward price pressure or are stable or rising.

Several commenters submitted data on indexes of investor confidence to argue that investor confidence has been restored and, therefore, short sale price test restrictions are not necessary.[153] In addition, one commenter submitted preliminary data, drawn in part from investor confidence indexes, on the relationship between short selling and investor confidence and stated that "[w]hile it is too early to draw conclusions from this data, the evidence presented . . . does not suggest that there is a negative relationship between short selling activity and investor confidence."[154] Another commenter submitted a survey showing that its clients put more money into the markets between Fall 2008 and Spring 2009 and that many of its clients do not believe that an overhaul of financial services regulation would restore investor confidence.[155]

We also note that some other commenters submitted surveys showing that reinstituting a short sale price test restriction would improve investor confidence.[156] One commenter submitted a survey showing that over 95% of the issuers participating in the survey believed that the market would function better with a short sale price test restriction and stated that this data "suggests that a price test would boost confidence."[157]

While the analyses of investor confidence indexes submitted by commenters do contain measures of investor confidence, we believe that the investor confidence indexes cited are

SEC_OEA_FCIC_001421

designed to capture elements of investor confidence not directly affected by regulatory changes. Investor confidence indexes often capture measures of systematic risk or optimism about the economy, as opposed to measures of investor confidence related to regulation designed to provide investor protections. In addition, in light of the surveys that were submitted in support of a short sale price test restriction as a means to restore investor confidence,[158] we do not believe that the surveys submitted to argue that a short sale price test restriction would not improve investor confidence[159] provide strong evidence on this point.

Although in recent months there has been an increase in stability in the securities markets, we remain concerned that excessive downward price pressure on individual securities accompanied by the fear of unconstrained short selling can undermine investor confidence in our markets generally. Further, we are concerned about potential future market turmoil, including significant increases in market volatility and significant price declines, and the impact of any such future market turmoil on investor confidence. Thus, we believe it is appropriate to adopt the targeted short sale price test restrictions contained in Rule 201.

In summary, we have reviewed the empirical data, analyses and studies submitted and carefully considered them in connection with our determination that it is appropriate at this time to adopt in Rule 201 a short sale price test restriction combined with a circuit breaker approach.

DRAFT MEMORANDUM

TO: Distribution List

FROM: Tim McCormick

Office of Economic Analysis

DATE: September 2, 2009

RE: Review of Studies on Naked Short Selling and Fails to Deliver

---

In this memorandum, we review the results contained in a number of external and internal studies that examine the topics of naked short selling and fails to deliver. We believe that this memo covers most, if not all, of the current work in this area but note that new work may be added over time. In general, it is important to realize that most studies use fails to deliver (FTDs) as a noisy proxy for naked short selling. Because of their general imprecision in measuring naked short selling, we caution against utilizing the precise estimates contained in these studies. At best, the preponderance of studies may provide a general direction of results. In summary, the preponderance of evidence suggests:

- Naked short selling is not harmful to the health of companies, stock prices, or market quality. However, under certain circumstances naked short selling could be misused as a tool to manipulate.
- Evidence pre-Regulation SHO suggests that traders strategically FTD to avoid borrowing costs. However, post-Regulation SHO there is no evidence of this.
- The research finds that Rule 204T led to significant reductions in FTDs.
- Some of the research finds that FTDs are structural in nature and not necessarily indicative of naked short selling. These findings reinforce our reservations about using FTD data as an accurate measure of naked short selling.

Prices and Manipulation

Many commentators contend that naked short selling and failures to deliver depress stock prices by facilitating abusive short selling and manipulation (e.g., Welborn (2008) and Christian, Shapiro, and Whalen (2006)). The research on this topic comes in several forms. Some research focuses on how FTDs affect stock prices on average, while other research focuses on special situations or evidence of manipulation/abusive trading.

While some theoretical research argues that naked short selling depresses stock prices, other theoretical research contends that naked short selling is no different from other short selling (Culp and Heaton (2007)) or does not require special regulatory treatment (Gruenewald, Wagner, and Weber (2009)). In general, none of this research is as rigorous as that considered publishable in peer review financial journals.

The empirical research on average associations generally either finds no association between failures to deliver and stock returns (Fotak, Raman, and Yadav (2009) and OEA (memo dated 9/21/2007)) or a positive relation (Boulton and Braga-Alves (2009a) and

SEC_OEA_FCIC_001423

Gjerde (2009)). Collectively, this research finds that threshold list additions are associated with positive returns or no return (Boulton and Braga-Alves (2009a) and Gjerde (2009)), increases in fails are not correlated with contemporaneous returns on the trading day (Fotak, Raman, and Yadav (2009) and OEA(2007)), fails increase following price increases (Boulton and Braga-Alves (2009a)), and fails do not precede price decreases (Boulton and Braga-Alves (2009a) and Fotak, Raman, and Yadav (2009)). These results seem somewhat mixed but all are opposed to the hypothesis that failures to deliver depress stock prices. Further, this empirical evidence has been checked for robustness and at least one was accepted at the most selective academic finance conference.

Even if fails are not associated with prices in general, there still may be special situations where failures to deliver or naked short selling can depress stock prices or contribute to the weakening of issuers. For example, Finnerty (2005) argues that naked short selling can depress stock prices around death spiral financing. This argument is not tested but is consistent with SEC enforcement and more general finance theory on manipulation (Allen and Gale (1992)). Others have examined contentions of naked short selling in Bear Stearns, Lehman Brothers, and others and found mixed results. Shapiro and Pham (2009) claims evidence of naked short selling by looking at monthly statistics, while the more precise daily statistics of Fotak, Raman, and Yadav (2009) and several OEA memos provide a different view. In particular, for Bear Stearns and a few other examples, an increase in failures to deliver coincides with trading occurring after large price declines and public news about the companies' distress. The Lehman Brothers results, however, are in contrast to the results in other case studies.[1]

Another way to examine special situations is to examine whether failures to deliver are associated with statistics that may indicate nefarious behavior. For example, Fotak, Raman, and Yadav (2009) examine order imbalances and positive and negative pricing errors that may indicate short-lived price pressure and Gjerde (2009) identifies companies that may be fundamentally weak. Increases in failures to deliver in conjunction with negative order imbalances, negative pricing errors, or weak companies may indicate that naked short sellers exploit weak markets and exacerbate volatility. However, neither of these studies provides evidence in support of this hypothesis. Instead, Fotak, Raman, and Yadav (2009) find evidence that failures to deliver increase in positive pricing errors, a result that supports the theory in Merrick, Naik, and Yadav (2005) that failures to deliver can help prevent upside price manipulations. Gjerde's (2009) results are more mixed, suggesting that failures to deliver are not associated with distress in NYSE stocks but they are in Nasdaq stocks.

In summary, the quality research on failures to deliver finds that while there are situations when failures to deliver can be associated with potentially abusive behavior, these situations are rare enough that the overall statistics show that failures to deliver are either unassociated with stock prices or help prevent overvaluation.

[1] Staff outside of OEA are aware of the timing of the failure to deliver in Lehman Brothers and have looked more into the trading around the collapse of Lehman. OEA is unaware of the results of this investigation.

SEC_OEA_FCIC_001424

Market Quality

The empirical research on average associations generally finds that naked short selling does not harm market quality (OEA memo dated January 14, 2009, Fotak, Raman, and Yadav (2009), and Shapiro and Pham (2009)) or that restrictions on naked short selling harm market quality (Boulton and Braga-Alves (2009b), Bris (2008) and Kolasinski, Reed, and Thornock (2009)). Collectively, this research finds that restrictions on naked short selling are associated with greater pricing errors (Fotak, Raman, and Yadav (2009), Bris (2008), and Kolasinski, Reed, and Thornock (2009)), higher bid-ask spreads (Fotak, Raman, and Yadav (2009), Boulton and Braga-Alves (2009b), and Bris (2008)), no change in bid-ask spreads (OEA (2009a)), higher volatility (Fotak, Raman, and Yadav (2009) and Bris (2008)), lower trading volume (Boulton and Braga-Alves (2009b), lower liquidity (Kolasinski, Reed, and Thornock (2009)), and overpricing (Boulton and Braga-Alves (2009b)). Shapiro and Pham (2009) find no relationship between trading volume and short interest.

The studies that find a positive or neutral effect on market quality from naked short rely primarily on examining the change in market quality before and after the July and September 2008 Emergency Orders that placed additional restrictions on naked short selling. Fotak, Raman, and Yadav (2009) is the most comprehensive because it examines both the July Emergency Order and other time periods. On the other hand, OEA (2009a), Boulton and Braga-Alves (2009b), and Bris (2008) examine the small number of securities affected by the July Emergency Order so it is very difficult to confidently attribute these results to a wider cross-section of stocks. Shapiro and Pham (2009) have a methodological error that makes their finding uninformative. Kolasinski, Reed, and Thornock (2009) examine market quality following the September 2008 Emergency Orders. However, they do not control for the financial crisis and other rule changes around this time so we caution against relying on their results too heavily.

While much of the empirical research argues that naked short selling has a neutral or positive effect on market quality, other research contends that naked short selling may increase volatility (Culp and Heaton (2007) and Lecce, Lepone and Segara (2008)), may increase bid-ask spreads (Lecce, Lepone and Segara (2008)), and may reduce liquidity (Gjerde (2009)). We note that this other research is generally harder to interpret. Culp and Heaton (2007) is not statistically rigorous. Lecce, Lepone and Segara (2008) examine naked short selling on the Australian Stock Exchange but it is unclear whether the results will hold under the different U.S. regulatory regime. Gjerde (2009) argues that fails to deliver are a symptom of poor market quality rather than the cause of poor market quality. However, he does not specifically test this contention so we don't know how to properly interpret his results.

In summary, the quality research on failures to deliver finds that failures to deliver have a positive or neutral effect on market quality. However, there is some evidence that naked short selling can be associated with poor market quality. These situations appear to be rare enough that the overall statistics show that failures to deliver are generally not detrimental toward market quality.

SEC_OEA_FCIC_001425

FTDs and Borrowing Costs

The research is mixed on the relationship between fails to deliver and borrowing costs. Research prior to Regulation SHO finds a positive relationship between FTDs and borrowing costs (Boni (2006) and Evans, Geczy, Musto, Reed (2009)) while research after Regulation SHO finds a negative relationship between FTDs and borrowing costs (OEA memo dated January 14, 2009). Both Boni (2006) and Evans, Geczy, Musto, Reed (2009)) find that market makers strategically FTD when borrowing costs are high. OEA (2009a) finds that borrowing costs increased at the same time that FTDs decreased following the July Emergency Order. That is, requirements to eliminate or reduce FTDs have the effect of increasing borrowing costs even in stocks that are easy to borrow. These mixed results before and after Regulation SHO suggest that increased restrictions on FTDs may have played an important role in changing the dynamics of FTDs and borrowing costs.

Overall, the limited research in this area suggests that the relationship between FTDs and borrowing costs has changed over time. Increased restrictions on FTDs may increase borrowing costs as more investors are forced to borrow. On the other hand, higher borrowing costs increase the incentives to FTD. Research in this area is severely limited due to the lack of transparency in the securities lending markets.

FTDs and Rule 204T

The research finds that Rule 204T led to significant reductions in FTDs (Kolasinski, Reed, and Thornock (2009), Shapiro and Pham (2009), and OEA memo dated April 16, 2009). Kolasinski, Reed, and Thornock (2009) find that the daily dollar volume of fails-to-deliver decreased nearly 80% following the September 2008 Emergency Orders. Shapiro and Pham (2009) also find significant reductions in FTDs after 204T but claim that the reductions are not sufficient. OEA (2009c) also finds that FTDs decreased significantly after the elimination of the OMM exception and the implementation of the T+3 Close-out Rule. Fails declined by 56.6% across all securities and 73.5% for threshold stocks. In addition, there is some evidence that optionable stocks experienced larger declines in FTDs than non-optionable stocks.

FTDs and a Pre-Borrow Requirement

As mentioned above, several studies examine the July 2008 Emergency Order that temporarily instituted a Pre-Borrow on a limited number of stocks (OEA(2009a), Boulton and Braga-Alves (2009b), and Bris (2008)). These studies provide mixed results on the effect of the Pre-borrow requirement on security prices and market quality. However, the studies consistently show that the Pre-Borrow requirement reduced fails (OEA(2009a)) and increased borrowing costs (OEA (2009a) and Sungard Astec Analytics (2008)). In addition, the Pre-borrow requirement drastically reduced the level of short selling (OEA(2009a)). This empirical evidence is limited in its applicability because the emergency order was short and the stocks included did not represent a broad cross-section.

SEC_OEA_FCIC_001426

Structural FTDs

There is limited research that finds that FTDs are structural in nature and not necessarily indicative of naked short selling (Edwards and Hanley (2009) and OEA memo dated March 26, 2009). Edwards and Hanley (2009) find that the level of FTDs is uncorrelated with the amount of short selling in IPOs. OEA (2009b) finds that higher fails are associated with ETPs with higher creation unit size, a larger proportion of short interest relative to shares outstanding, more shares outstanding, and more actively traded options.

Revisiting the evidence on Short Sale Volume: Short-run return prediction

J. Daniel Aromi
Cecilia Caglio

December 2009

Abstract

This work presents a detailed study of return predictability from short sale volume. The analysis considers daily short sale volume and is focused on short-term return prediction. The results indicate that return predictability is mostly the result of the positive abnormal returns of the group of stocks with low short selling volume. The predictability is more evident for stocks with low past returns, low contemporaneous returns and high volume. Unlike previous studies that focus on short seller's information on overpriced stocks, the evidence on this study suggests that short term return predictability can be the result of fire sales and high-volume return premium.

1. Introduction

The role of short selling in securities markets is a central debate among academics, regulators and practitioners. The analysis of whether short sellers are able to predict returns has been one of the ways in which researchers have shed light on the nature of short selling activity. Several studies have documented that stocks with higher short sale volume underperform stocks with lower levels of short sales. Boehmer, Jones, and Zhang (2008) and Diether, Lee, and Werner (2008) are among the latest examples. The interpretation of these results is that short sellers are sophisticated market participants that trade using information about stocks that is not fully incorporated into prices. In addition,

SEC_OEA_FCIC_001430

Diether, Lee, and Werner (2008) show that short sellers increase their trading following positive returns and they correctly predict future negative abnormal returns.

While we do not rule out the notion that short sellers have information not reflected in stock prices, this work presents evidence that suggests alternative explanations of return predictability, at least for the specific frequencies considered,. This study shows that return predictability from short sale volume is mainly driven by short sellers avoiding stocks that are about to rise. The evidence that short sellers can predict negative returns is significantly weaker. This implies that the price prediction analysis does not provide evidence that short sellers can earn positive profits on short sales alone. In particular, short sellers' strategies do not seem to have predictive power for stocks with high returns in the past. We conclude that our results do not provide evidence on short sellers detecting overpriced stocks. This can be due to the prevalent use of short sales for reasons other than speculative trading. In addition, speculative short sales might be profitable at higher or lower frequencies not considered in the present study.

The analysis shows that the abnormal return of stocks with low short sale volume is higher when the past and contemporaneous returns are low. In other words, stocks with low past returns and a high proportion of long sales (compared to short sales), are on average expected to show future positive abnormal returns. This evidence is consistent with sales by distressed owners of the stock. The sales have a temporary negative impact on the price of the stock (for example, see Coval 2007 and Brunnermeier et alt. 2005) but positive future returns.

SEC_OEA_FCIC_001431

We also consider whether price prediction is affected by variation in trading volume. The evidence suggests that price prediction is more evident for stocks that experience high daily volume compared to past values. As in our previous analyses, we find that price prediction is mainly the result of the positive abnormal returns of stocks with low short sale volume. This finding is associated with the literature on high-volume return premium. This literature has documented that positive variations in volume predicts positive abnormal returns. The explanations for this regularity included liquidity risk premium (Pastor et alt. 2003), higher visibility (Gervais et alt. 2001) and turnover as proxy for investor sentiment (Baker et alt. 2004). Our study refines previous analyses by making a distinction between total volume and short sale volume. We show that increases in volume predict positive abnormal returns as long as the shock in volume is not due to high short sale ratio.

The findings have implications for the understanding of short selling activity. One possible interpretation of the results is that most short sale volume is due to non-speculative reasons, such as hedging and market making. As a result, our measure of short selling activity is not able to capture the profits realized by the fraction of the short sales from speculative strategies. Alternatively, it is also possible that short sales are profitable at frequencies that are different from the ones we considered in this study. These could be higher frequencies (i.e. intra-day) or lower frequencies (e.g. monthly or lower). In addition, we would like to note that our analysis fails to detect patterns in which days of high short sale activity and negative returns are followed by days of positive returns. A pattern like this could have been an indication of short sales systematically pushing stock prices to artificially low levels.

SEC_OEA_FCIC_001432

Our paper is organized as follows. In the next section, we describe related literature. Section 3 details the data. Section 4 explains the methodology. The results presented in section 5 and section 6 concludes.

2. Related literature

The theoretical and empirical literature on short sales is extensive. Miller (1977) presents a theoretical model in which investors hold different opinions and short sale constraints result in upward bias of prices. The theoretical model of Diamond and Verrecchia (1987) shows that the presence of short sale constraints, while it does not create an upward bias of prices, slows the transmission of investors' information to prices.

This paper is related to existing empirical work on predictability of short selling. Several papers have shown that short sale volume and short interest can be used to predict future price movements and corporate events (Asquith and Muelbroek (1995), Aitken, Frino, McCorry and Swan, 1998; Desai, Thiagarajan, Ramesh, and Balachandran., 2002; Desai, Krishnamurthy and Venkataram, 2006; Christophe, Ferri, and Angel, 2004, and Boehmer, Jones, and Zhang, 2008; Diether, Lee, and Werner, 2008).

The most closely related work to our study is Diether, Lee, and Werner, 2008 and Boehmer, Jones, and Zhang, 2008. The first study shows that short selling activity predicts negative abnormal returns as much as 5 trading session. Their interpretation of the results is that short sellers are able to detect short term deviations of price from fundamental value. Boehmer, Jones, and Zhang (2008) complete this evidence by

SEC_OEA_FCIC_001433

showing that heavily shorted stocks underperform lightly shorted stocks, indicating that short sellers are sophisticated market participants.

A recent paper by Engelberg, Reed and Ringgenberg (2009) looks specifically at differences between the timing of short sellers' trades and the overall market. Their results show that short sellers don't anticipate news but they are better at processing public news. This suggests that short sellers trade on publicly available information, and as such, their evidence calls into question whether short sellers disproportionately engage in information-based manipulation strategies.

Some of our findings are connected to the literature on fire sales (Coval et al. 2007) and predatory trading (Brunnermeier et alt. 2005). This literature studies the forced sale of assets by large institutional investors. These investors' trades have a negative price impact that is later reversed as prices returned to fundamental values. The negative price impact is stronger for the case of investors with more need for immediacy and when the investor position is learned by contraside market participants.

Finally, our analysis is also related to papers documenting that volume contains information that is useful in predicting short-horizon returns (Gervais, Kaniel, and Mingelgrin, 2001; Llorente, Michaely, Saar, and Wang, 2002). Gervais et al. (2001) investigate whether the trading volume of a common stock can be used to predict stock returns. Their interpretation is that high volume increases the visibility of a stock and this tends to be followed by positive excess returns, whereas periods of extremely low volume tend to be followed by negative excess returns. Other explanations suggested for this regularity are liquidity risk premium (Pastor et alt. 2003) and investor sentiment (Baker et alt. 2004).

SEC_OEA_FCIC_001434

3. Data

Our dataset covers the period from January 2005 through March 2009. The short sale data are obtained from the following Self Regulatory Organizations: NASDAQ, NYSE, NYSE-ARCA, AMEX, FINRA, and BATS.

Daily volume and returns data is collected from CRSP. Our database includes only common stocks (CRSP share codes 10 through 12) with prices above $5. For the purpose of this analysis we have excluded volume and short sale information corresponding to the days in which the short sale ban on financial stocks was effective (September 19-October 8 2008). The factors in the Fama-French regression are from Kenneth French's website.

4. Methodology

To measure the information content of short sale volume we form portfolios based on the short selling ratio, defined as the proportion of the daily total volume that corresponds to short sales for each stock on each day. On each day we rank each stock by short sale ratio level and we identify the subset of securities in the first quintile (low short sale volume stocks) and the fifth quintile (high short sale volume stocks). We then form a portfolio that has long positions for the subset of stocks in the first quintile and a portfolio with short positions in the subset of stocks in the fifth quintile. The weight for the securities in each portfolio is given by their respective market capitalizations. Finally, we form a long-short portfolio that has equal amounts invested in the long and the short portfolio. Let "r_{tk}" denote the return on day "k" of such a portfolio formed using volume and short sale information on day "t". To correct for the overlapping of holding period returns, we

SEC_OEA_FCIC_001435

use the calendar time approach (see Boehmer et alt 2008). We compute the daily return as:

$$R_k = \sum_{t=k-n}^{k-1} \frac{r_{tk}}{n}$$

This is the average return on day k of the long short portfolios formed with information corresponding to days “k-n” through “k-1”.

To calculate abnormal returns we will estimate Fama-French alpha, that is the intercept of the following regression:

$$R_t = \alpha + \beta_1 RMRF_t + \beta_2 SMB_t + \beta_3 HML_t + \beta_4 MOM_t$$

In considerable parts of the analysis we will use this methodology for a subset of securities. For example, we will divide our dataset by terciles according to market capitalization levels into small, medium and large market capitalization groups. We will also analyze subset of securities formed by considering the cumulative return of the stocks in the previous forty trading sessions, the return of the stock on the day in which the short sales occur and the volume on the day in which trade occurred.

5. Results

In this section, we present an extensive analysis with the objective of generating evidence that can support or counter different explanations for short sale volume return prediction.

SEC_OEA_FCIC_001436

The future return information contained in short sale volume can shed light on the role of short selling in financial markets. In addition, the observations can be linked to other questions that are not directly related to short sales. In particular, we find that data suggests possible explanations related to high-volume return premium and price impact of investors' fire sales.

Table 1 presents descriptive statistics. As indicated in the methodology section we divide the stocks in our sample in three groups by market capitalization levels. There are significant difference in the values of the means and standard deviations. In line with the previous literature, in our sample short-selling represents on average 24% and 30% of share volume for small capitalization stocks and for large capitalization stocks, respectively.

As initial exercise and for comparison purposes, table 2 shows the estimated abnormal returns for portfolios formed using total volume and short sale volume information corresponding to the previous five trading days.

For large and medium market capitalization stocks, a long-short portfolio strategy based on short sale ratio information would have earned a statistically significant abnormal return of approximately 5 basis points for each of the five following days. These results are in line with the evidence reported in previous literature. However, when we analyze in more detail the source of this return, we notice that the negative abnormal returns of stocks with high short selling ratios is small compared to the positive abnormal returns of stocks with low short selling ratios. This means that most of the return prediction of the long-short portfolio strategy is explained by abnormal returns of the subset of securities with low short sale ratio. The abnormal negative returns on portfolios with heavily

SEC_OEA_FCIC_001437

shorted stocks range from 1.86 basis points for high market capitalization stocks to 0.13 basis points for small capitalization stocks, but the returns are not significantly different from zero. In contrast, the portfolio of lightly shorted stocks produces a positive abnormal return of almost 4 basis points for high market capitalization stocks and medium capitalization stocks.[1]

This evidence does not provide support to the most popular explanation for short-run return predictability from short sale volume. This explanation is based on short sellers being better informed or being more sophisticated at processing information that allows them to detect overpriced stocks (see Diether et alt. 2008, Boehmer et alt. 2009).

Sorts by contemporaneous and past returns

Considering subset of securities with specific characteristics can result in a better understanding of the explanations behind short sale volume return prediction. With that purpose, we study differences in return predictability for stocks with different contemporaneous returns and past returns. For each market capitalization level and each trading day, we divide stocks into terciles by cumulative returns in the past 40 trading sessions. Then for each group, we further divide stocks into three subsets based on contemporaneous, i.e. same day, return. For this variable, the thresholds are the 20^{th} and the 80^{th} percentile. These partitions result in nine subsets of stocks for each market capitalization levels. We evaluate in differences in price predictability for each group.

[1] For small market capitalization stocks the short sale ratio is not predictive of future returns. However, this last result will change when we perform more detailed evaluations of return prediction.

SEC_OEA_FCIC_001438

The results in Table 3 show that, for each market capitalization level, price prediction is the most noticeable for stocks with low past and low contemporaneous returns. For example for large market capitalization stocks, the abnormal return of the long-short portfolio for stocks that experience low past returns and low contemporaneous returns is 15.36 basis points. In contrast, the abnormal return of the long-short portfolio for stocks with high past returns and high contemporaneous returns ranges from 5.55 basis points for high capitalization stocks to 2.39 basis points for small capitalization stocks. Consistent with the previous analysis, most of the predictability is due to the positive abnormal returns of stocks with low short selling ratio. For high market capitalization stocks with low past and contemporaneous returns, the abnormal return of the portfolio with low short selling ratio is 13.56 basis points.

This evidence calls into question the association of return predictability from short sale volume with short sellers' ability to detect and identify stocks that are overpriced. A more plausible explanation for these findings is that the overperformance of stocks with low short selling ratio is the result of trades by institutional investors that own the stock and ensuing negative price impact of the trades. According to empirical and theoretical literature, the price impact can be significant in particular if the investors demand immediacy and this is know by contraside market participants(see Coval et alt. 2007 and Brunnermeier 2005). This price impact is expected to be later reversed if it is the case that the trade contains no information on the fundamentals of the stock. This regularity is expected to be stronger for past losers if it is the case that institutions are more likely to sell past losers either due to window dressing (see Lakonishok et alt. 1991) or due to

SEC_OEA_FCIC_001439

redemptions that follow negative returns (see Coval et alt. 2007). In addition, Coval et alt. (2007) and Li(2006) document institutional investors tendency to sell past losers.

Return prediction by contemporaneous volume

In this section we use contemporaneous volume instead of contemporaneous returns to form subset of stocks. For each trading session, and each group of stocks as classified by market capitalization and past returns (cumulative returns in the previous 40 trading sessions), we divide stocks into three groups by change in volume. We calculate the percentage difference between the current volume and the average volume in the previous 40 trading sessions. Stocks in the lowest quintile and the highest quintile of each group are allocated to the low and high volume group respectively.

The results are reported in Table 4. For medium and large market capitalization stocks, price prediction is significantly higher for stocks with volume above their historical average. As in the previous section, for high market capitalization stocks, price prediction is higher for stocks with low past returns. As in the previous section, we observe that price prediction is mainly driven by the abnormal positive returns of past losers stocks with low short sale ratio. The average returns of a long portfolio composed by lightly shorted stocks ranges from 18.23 basis points for large capitalization stocks to 10.97 basis points for small capitalization stocks. We have also performed additional analyses (not reported) for groups of stocks with different levels of contemporaneous returns. In these analyses we find that high volume is associated with more noticeable price prediction, independently of the contemporaneous return of the group of stocks.

SEC_OEA_FCIC_001440

This observation can be linked to findings captured by the literature on "high-volume return premium" literature. This regularity has received different explanations in the literature including: "visibility", investor sentiment and liquidity premium. Gervais et alt. 2001 documents that high volume levels predict higher returns in the short run. Their interpretation of this regularity is that high volume increases visibility of the stock and this, in turn, increases demand. Baker et al. 2004 develop a model in which "investor sentiment" is a consequence of investors that overweight the value of their private information. Pastor et al. (2004) indicate that stocks with liquidity shocks are expected to pay a premium.

Our findings indicate that unusually high volume predicts positive abnormal return only for the case of stocks in which the higher volume is mainly driven by trades that do not involve short selling.

For small market capitalization stocks high volume is associated with high return prediction independently of the level of short sale ratio.

Return prediction by market conditions

In this section we focus on how the return prediction of short sale volume changes under different market conditions. In particular, we would like to test the hypothesis that during periods of negative market returns negative returns during trading sessions with high short sale volume are more likely to be reversed in the following trading sessions.

SEC_OEA_FCIC_001441

We divided our sample period in three groups as a function of the cumulative market returns in the previous 50 trading sessions. We use 5% and -5% as the breakpoints for the three groups.

Table 5 shows the results for the group of high market capitalization stocks. Price prediction is larger for days that follow periods of negative market returns. In addition most of the price prediction seems to come from the abnormal positive returns of stocks with low short selling ratio. Price prediction is smaller for days that follow periods of positive market returns.

For trading sessions that follow periods of negative returns, the overperformance of stock with low short sale ratios and low past and contemporaneous returns is surprisingly high. The estimated alpha is 32 daily basis points. This evidence provides additional support hypothesis that price prediction is in great part explained by fire sales by institutional investors.

5. Concluding Remarks

This paper expands the literature on return predictability from short sale volume. A detailed study is executed with the objective of gaining a better understanding of the underlying reasons for the documented predictability. The analysis is focused on measuring predictability for low versus high short selling ratio stocks. Different categories of past and contemporaneous returns and volume have also been considered.

SEC_OEA_FCIC_001442

Our results show that there is no indication of return reversals even when we focus on specific market conditions and different levels of past stock returns. We find that most of the predictability of future returns seems to be explained be the subset of securities with low short sale ratio. In addition, return prediction is more noticeable on periods of negative returns, for stocks with low past returns and contemporaneous low returns and high volume.

The empirical literature on short sales is vast. It includes analysis of return predictability from short interest. Other studies focus on short sales and corporate events (e.g. earning surprises, earnings restatements). Our findings are in conflict with a fraction of the literature on short selling that concludes that short-run return predictability from daily short sale volume is explained short sellers' ability to detect overpriced stocks. From our short term return analysis, we do not find that high short sale volume predicts lower returns. Our observations shed light on other factors as possible explanations of short sale volume return prediction.

There are several reasons that can explain why we are not able to capture short term underperformance for stocks with high short sale volume. Short sales could be used for other reasons such as market making, arbitrage and hedging. In addition we are not able to observe the moment in which the positions are covered.

Our findings lend support to explanations based on "high-volume return premium" and "fire sales". More research needs to be done to determine the relative merits of these alternative explanations.

Table 1 - Descriptive Statistics

This table reports the summaries statistics. The dataset corresponds to the period January 2005 through March 2009. Daily volume and returns data is from CRSP. The short sale data corresponds to data from the following Self Regulatory Organizations: NASDAQ, NYSE, NYSE-ARCA, AMEX, FINRA, and BATS. Stocks are classified in three groups by market capitalization levels.

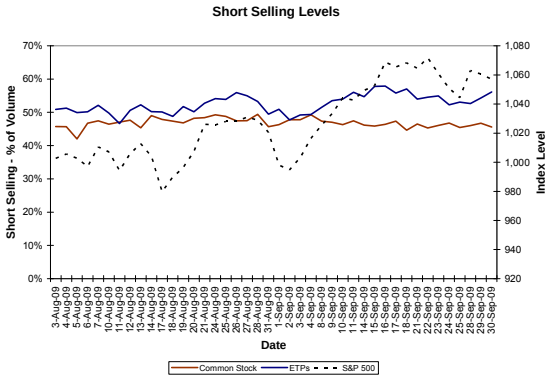
DRAFT for Comments

Monthly Short Selling Report

Total Short Selling

In September 2009, short selling accounted for **47%** of reported volume in common stocks according to the daily short selling volume data.[1] This is similar to the August 2009 figure. This level was fairly constant throughout the month and short selling fluctuated slightly with the market, as reflected in the S&P 500 index levels (17% correlation coefficient). In particular, the level of short selling in common stock seems to decline slightly when the S&P 500 declines.



Short selling of exchange traded products (ETPs) in September was slightly higher than that of common stock at 54%, a small increase from August. This level did not vary much throughout the month, but it does seem to vary a little with the level of the S&P 500 (6% correlation coefficient).

Most-Shorted Securities

The daily data is also useful for identifying the most shorted securities. Please contact OEA if you would like more information on the most-shorted stocks. In September, the stock most shorted was Anheuser-Busch, an ADR that listed on the NYSE on September 16th. Short sales made up 73.5% of the share volume. The shorting in Anheuser seemed higher when prices were rising as the level of short selling has a positive 72% correlation with the stock returns in Anheuser. In addition, the price of Anheuser rose 5.9% in the month of September.[2]

All of the securities that were shorted the most in September had prices that went up and most had short selling that was positively correlated with returns. Securities with positive correlations are unlikely candidates for manipulation because short selling is higher when prices are rising.

Ticker	Name	Short Level	Correl	Return
	Common Stock			
BUD	Anheuser-Busch	73.5%	72.2%	5.9%
WGD	Winnebago	72.3%	-12.2%	21.6%
UMC	Untd Microelec.	68.3%	32.0%	16.9%
CBEY	Cbeyond Inc	68.2%	10.3%	12.3%
NBG	Ntl Bnk of Greece	66.7%	49.1%	12.8%
	ETPs			
PSP	PwrShrs Priv Eq	78.9%	-9.0%	9.5%
VIG	Vanguard Div	78.2%	67.2%	3.1%
FCG	Natural Gas	75.6%	34.7%	15.5%

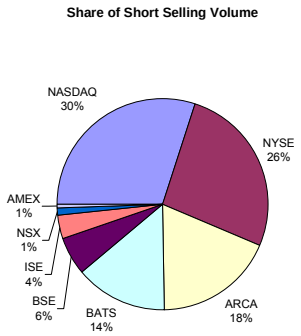
QQQQ	PwrShares QQQ	71.0%	8.8%	5.7%

For Winnebago and PowerShares Listed Private Equity, the correlation between the short selling level and the security return is negative. This means that short selling is higher when prices are going down. The short selling in these securities is not necessarily abusive and much more analysis would be necessary to determine manipulative intent. A negative correlation could indicate that short sellers applied price pressure without any manipulative intent or that they were merely passive momentum traders.

Market Share

We also examined which markets tend to account for more short selling.[3] Some strategies may involve shorting only on certain exchanges. We found that the markets' share of short selling coincided closely with the markets' share of volume, but Nasdaq's share of short selling was 1.2% higher than it's share of all volume and NYSE's share of short selling was



1.7% lower than it's share of all volume.

[1] This might be an overestimate because stocks that have no short selling may not show up in the data. In addition, our classification into common stock is imperfect and based on characteristics of the ticker and absence from a list of ETPs.

[2] Note that the short selling data started only upon listing but the price information is available for the whole month. The return from the listing date to the end of the month was -0.7%.

[3] FINRA has not yet started to disseminate the volume data, so this analysis does not reflect TRF activity.

Reading Summary for Short Sale Ban in September 2008
By Susie Iredale

Author	Cohen, Gregory
Title	The 2008 Short Selling Ban: Effects on Banned Stocks with and without Traded Options
Journal/Date	May 2009, NYU Undergraduate Thesis
Data	-Banned financial stocks divided into 2 categories: those with traded options and those without, as well as non-banned S&P 500 stocks, as control group -Used Bloomberg terminal to determine the 277 of 797 stocks that had exchange traded options -Put and call volumes for 277 banned stocks with traded options and those in the S&P 500 with exchange traded options
Methodology	-Looked at average returns, options volume and used t-tests to determine whether the differences were significant
Conclusions	-Banned stocks with tradable options had higher total options volume and lower returns than banned stocks without tradable options (approx. 10% greater), difference in returns expired after the ban -In contrast to BJZ, finds that investors used options to synthetically short sell banned stocks during the ban.

Author	Gagnon, Louis & Jonathan Winter
Title	Short Changed? The Market's Reaction to the Short Sale Ban of 2008
Journal/Date	Preliminary, June 2009 http://ssrn.com/abstract=1421490
Data	Canadian stocks that were cross-listed – final sample consisted of 55 Canadian including 8 financial firms subject to the ban
Methodology	FE Panel Regression on dummy for ban period or ban stock, post-ban period, and intersection of post-ban * ban stock, and firm level (bid-ask spreads, volatility) and market-level control (market volatility index) (Prices are in USD, using exchange rate at end of day)
Conclusions	1. The short sale had a significant impact on the trading attributes of the stocks that were subjected to the ban – during the ban financial stocks trading volume migrated from U.S. to Canada 2. The US listings of the Canadian stocks were trading at a significant premium, but the premium was only evident on negative US market return days

Author	Lioui, Abraham
Title	The Undesirable Effects of Banning Short Sales
Journal/Date	EDHEC Risk and Asset Management, April 2009
Data	-January 2007 to January 2009, built two dummies, financial crisis=1 after July 2007, short sale ban=1 after September 2008 (total of 514 trading days) -Daily data for indices, stock prices/returns and trading volumes for stocks that were subject to the ban in the Paris stock market and indices
Methodology	-Added lag of dependent variable in regression, which he claims reduces the need for a control group since the 2 dummies capture the general economic environment

	-Used 60 day rolling windows to build long series of volatility, skewness and kurtosis of stocks: for each day calculate the standard deviation of the returns for previous 60 days -Regress daily volatility on lag of volatility, crisis & ban dummy -Regress stock return onto corresponding market return (to get CAPM Beta for each stock and sample period) with and without crisis and ban dummies -Create moment estimate of daily skewness, then regress on lag of daily skewness and dummies -Create moment estimate of daily kurtosis, then regress on lag of daily kurtosis and dummies
Conclusions	-Though there may have been changes in skewness of the returns of both indices and banned stocks, the crisis and the ban had no systematic impact -For the FTSE and IBEX 30, the impact of the ban was positive and statistically significant -The ban seems to have made the swings of the market even wilder -American based indices saw their kurtosis (fat tails) fall during the crisis, while European indices saw theirs rise, -During the crisis, kurtosis rose for all individual stocks, but unclear for the ban -Neither the crisis nor the ban had any impact on the extreme movements of markets or stocks

Author	Marsh, Ian & Norman Niemer
Title	The Impact of Short Sales Restrictions
Journal/Date	ISLA/AIMA/LIBA, November 2008
Data	Stock Return Data from Jan 2008 to Oct 2008 (Datastream)
Methodology	-Look at standard moment conditions: mean, median, std. dev., skewness, and kurtosis, first order autocorrelation, strength of corr between individual and market index returns (goodness-of-fit) -Regress skewness, kurtosis, and autocorrelation on “initial” (value of statistic in initial period), dummy for financial stock, dummy for “ban”=1 if stocks are subject to new restriction on short selling in post-restriction period, dummy for “covered”=1 if restrict covered short selling, and dummy for “econ”=1 if restriction extend to economic interests -Compared data across 6 countries (U.K., U.S., France, Germany, Sweden & Japan)
Conclusions	-No clear relationship between the short sale restrictions and the distributional properties of the returns -Kurtosis falls in 5 of 6 countries (not in UK, not all results are significant) -Skewness has mixed results and is generally not statistically significant -Changes in autocorrelation are not systematic and do not point to increase market inefficiencies -No strong evidence that the short sale ban changed the behavior of stock returns -Key changes in statistics seem to be driven more by sector-wide influences than the short sale ban.

SUMMARY OF SHORT SALES RULES IN IOSCO TECHNICAL COMMITTEE JURISDICTIONS

I. JURISDICTIONS WITH UPTICK RULES

- Australia
- Hong Kong
- Japan
- Mexico

II. REQUIREMENTS RELATING TO DISCLOSURE OF SHORT SALES:

A. Jurisdictions requiring disclosure of short sales to exchanges:

Australia: Market makers must disclose short sales to the exchange by 9am the day after the trades were placed. The ASX publishes daily aggregated short sales data.

Hong Kong: Intermediaries must disclose short sales to the exchange at the time the trades are placed. The Hong Kong Exchange publishes daily aggregated short sales data.

Japan: Intermediaries must verify and mark whether transactions are short sales at the time trades are placed. The exchanges disclose on a daily and weekly basis the volume of short sales that are carried out through margin transactions (not those short sales that result from stock lending transactions). The total volume of short sales is disclosed on a monthly basis.

Ontario: Intermediaries are required to disclose consolidated short positions in all listed securities twice per month and report them to the relevant exchange within two days of calculating the short positions. The exchanges make this information public twice per month.

Switzerland: The SWX will require disclosure to the SWX of net short positions greater than 0.25% of the ordinary stock of Swiss listed financial institutions held on 1 October 2008. This disclosure must be made by 3 October 2008.

B. Jurisdictions requiring disclosure of short sales to regulators:

Netherlands: Disclosure to the AFM is required of any net economic short positions exceeding 0.25% of the capital of one of the financial companies listed on the Euronext Amsterdam stock exchange. This disclosure is required no later than the day after acquiring the position.

C. Jurisdictions requiring disclosure of short sales to the public:

France: Disclosure to the AMF is required of any net economic short positions exceeding 0.25% of the capital of French financial companies listed on regulated French exchanges. This disclosure is required no later than the day after acquiring the position. This information is made public via exchanges.

Spain: Disclosure to the CNMV is required of any net economic short positions exceeding 0.25% of the capital of specified listed Spanish financial companies. This disclosure is required no later than 5pm the day after acquiring the position. This information is made public.

United Kingdom: The FSA requires daily disclosure to UK exchanges of net short positions greater than 0.25% of the ordinary stock of UK financial institutions listed in the UK. This information is made public via exchanges.

III. JURISDICTIONS WITH BANS ON NAKED SHORT SALES:

A. Jurisdiction with no restrictions on naked short sales:

- Japan
- United Kingdom

B. Jurisdictions with bans on all naked short sales:

1. All short sales are banned for all Australian-listed securities.

2. The following jurisdictions prohibit naked short sales through the imposition of a pre-borrow requirement:
    - Hong Kong
    - Spain
    - Mexico
    - Switzerland

3. The following jurisdictions have banned naked short sales of the securities of domestic listed financial institutions by requiring that market participants pre-borrow securities:
    - Germany: Order ends 31 December 2008.

IV. BANS ON COVERED SHORT SALES:

A. Jurisdictions that have banned covered short sales of all listed securities:

Australia: All short sales are banned for all Australian-listed securities.

B. Jurisdictions that have banned covered short sales of the securities of financial institutions:

Ontario: The OSC has banned covered short sales of financial institutions listed on both US and Canadian exchanges, and one financial issuer whose shares are exchangeable. This order expires on 3 October, but the OSC has indicated that it will follow the SEC's lead in terms of renewing it or allowing the order to lapse.

France: The AMF has banned short sales of French financial institutions listed on French regulated exchanges. This order will last until 22 December 2008.

Italy: The CONSOB has banned short sales of Italian financial institutions listed on Italian regulated exchanges. The order will end on 31 October 2008.

C. Jurisdictions that have banned the creation of or increase in a net short position in securities of financial institutions:

Switzerland: The Swiss Exchange (Europe) has prohibited the active creation of net short positions of Swiss financial institutions listed in the UK. This order will last through 19 December 2008.

- As of 2 October 2008, the Swiss Exchange (Europe) will prohibit the creation or increase of net short positions, either naked or uncovered, in listed Swiss financial stocks.

United Kingdom: The FSA has prohibited the active creation of or increases in net short positions of UK financial institutions listed in the UK.

Netherlands: The AFM has prohibited the active creation of or increases in net short positions of Dutch financial institutions listed on Euronext Amsterdam.

Volatility or EO related study areas and statuses as of 1/13/09:

1. Role of Short Selling in Events leading up to Sept EOs. (i.e., did short selling amplify volatility?) This has implications for the motivation for the Sept EOs Staff: Cecilia, Daniel
    a. Could cover questions related to tick test – liquidity supplier vs. demander; taking out bids; etc.
    b. Covers questions on momentum vs. contrarian strategies.
    c. Currently includes September only.
    d. Status: Initial memo circulated. Expanding into paper. Potential deadlines in March or April.
2. Hypothetical view of whether a short sale price restriction would have restricted short selling in the period prior to the September EOs. Staff: Daniel and Cecilia
    a. How many short sales executed at prices below where they would have if a rule had been in effect?
    b. For what proportion of the day could short sales have been entered at prices below the best ask if a rule had been in effect?
    c. What is the execution probability and delay for simulated short sales?
    d. Status: memo circulated.
3. Volatility.
    a. Intraday analysis over long time series. Staff: Stewart
        i. Status: Initial memo will be circulated soon.
    b. Time series – systematic vs. idiosyncratic
        i. Status: work has not started.
    c. Time series – leverage effects when prices drop
4. Effect of September EOs – expands on preliminary analysis – some with an eye toward T+3 implications.
    a. Failures to deliver. Staff: Tim
        i. Status: memo circulated and in the public file. Memo updated 1/14/09.
    b. Equity lending. Staff: Nick
        i. Status: memo is being polished.
    c. Short selling.
        i. Nick started summarizing short selling during the ban for OCIE but could not finish it within OCIE's tight deadline.
        ii. Status: no one currently assigned, but could be a part of expanding on the short selling analysis by Daniel and Cecilia.
    d. Short interest.
        i. Tom is updating the short interest data attached to industry codes and shares outstanding twice a month.
        ii. Status: we have not updated a broad analysis but use the data for requests.
    e. Equity spreads and depth.
        i. Status: Need to revisit the feasibility given other projects.
    f. Equity and option volume, volatility, and equity returns.
        i. Status: data from Option Metrics and Datastream has been pulled and some analysis has been started. No additional progress expected soon.
    g. Option spreads: Ira

        i. Status: memo is being polished.
    h. Arbitrage. Staff: Scott
        i. Status: Scott has not updated the study recently but says that an update would not take too long.
    i. Repurchases. Staff: Kathleen
        i. Status: likely to be too much work for the potential benefit. On hold.
5. Study of turnover of FTDs. What is the typical turnover of fails in stocks that are persistently on the threshold list? Has T+3 implications and can help explain why stocks can stay on the threshold list for long periods of time without any rule violations. This has implications for the motivation for T+3.
    a. Status: back burner.
6. Various checks on individual stocks or days.
    a. At the request of TM, OCIE, or other offices, we get at least one request a week to summarize statistics in a given stock or on a particular day. Amy and Tim have been handling many of these.
7. Convertible preferreds. Staff: Tim
    a. When looking into NCC, it appears much of the short selling and fails were driven by a convertible preferred offering. This is more broadly interesting for several reasons. (1) The convertible preferred allowed NCC to effectively issue vast new equity without getting prior shareholder approval as required by NYSE rules. Are NYSE listed firms using these types of issues to avoid NYSE corporate governance rules? (2) Convertible preferreds have been used in the past as last resort financing by small struggling companies. Are large companies, particularly finance companies using these now? (3) Convertible preferreds can be structured in a way that encourages short selling by those who hold the preferreds. Are companies that have issued convertible preferred more likely to have high short selling? Does the structure of the preferred matter?
    b. Status: exploratory

Trading examples applying the uptick rule and modified uptick rule ("upbid rule")

The following spreadsheets provide examples of how the proposed uptick and modified uptick rules would function. The examples include an eleven second snap-shot of an active stock, Citigroup ("C") and a half hour snap shot of a less active stock, Boston Beer ("SAM"). During the periods examined, there were 211 trades and 861 quotes in C and 36 trades and 3,746 quotes in SAM. To figure out the direction of the change in the bid, we constructed an nbbo from the quote sequence in the data. This resulted in 11 nbbo changes in C and 792 nbbo changes in SAM.

How to read the spreadsheets:

The first spreadsheet shows the trades and nbbo quotes in SAM. The first three columns give the *symbol*, *date*, and *time* of the observation (quote or trade). The first observation is at 10:30:05 on October 21, 2008. The next two columns, *price* and *size*, are filled only for trade observations, while the *nbbid* and *nbask* are filled only for quotes (changes in the nbbo). The first observation is a trade for 100 shares at $42.10. The next seven observations are nbbo changes within the same second as the first trade.

The last two columns provide information on the application of the *uptick* and *upbid* rules. The *uptick* column shows the direction of the last change in the transaction price. A "+" indicates an uptick and a "-" indicates a downtick. The *upbid* column shows the direction of the last change in the bid price. A "+" indicates an upbid and a "-" indicates a downbid. By construction the first trade is set to a downtick and the first quote is set to a downbid.

The last two columns also show whether the trade at that price and time could have been a short sale satisfying the uptick or upbid rule. Specifically, the column is shaded in green when the trade would have met the rule.

The applying a rule to trades that have already occurred requires the assumption that the rules would not have changed the sequence of trades and quotes. Based on the Pilot results, we know that this assumption is not true, but the examples can still provide useful illustrations.

We also apply the strong assumption that all market participants can observe the sequence of trades and quotes that are in the spreadsheets prior to the trade. We call this assumption "perfect information." Later, we relax this assumption and call it "sequence uncertainty."

Examples with perfect information:

Uptick Rule and SAM
The uptick rule says that a short sale can only execute at a price that is greater than the last different price. To determine this, we keep track of the price changes and ignore the quotes. The first trade at $42.10 is a downtick by construction, so could not be a short sale. In fact, there are no upticks in SAM until 10:34:02. At this time, a trade at $42.085 creates an uptick and could have been a short sale that complies with the uptick rule. In total, of the 36 trades in SAM, 16 occur on upticks or zero upticks.

SEC_OEA_FCIC_001466

Upbid Rule and SAM
The upbid rule says that a short sale can occur at the bid price or high if the last change in the bid price was up. Otherwise, a short sale can only occur above the bid. The trade at 10:30:11 was at the national best bid price of $42.08. Because that bid price was an upbid, this trade could have been a short sale that complied with the upbid rule. The next trade at 10:31:20 occurred at the national best bid price as well. But because that bid price ($42.06) was a downbid, the transaction could not have been a compliant short sale. The next compliant short sale occured at 10:34:02. In this case the transaction occurred at $42.085, which was above the national best bid ($42.07) at the time. Therefore, this transaction could have been a short sale regardless of whether the concurrent bid was an upbid or downbid. In total, of the 36 trades in SAM, 25 would have satisfied the upbid rule.

Uptick Rule and C
The first 35 trades in C occurred at $14.38, which was a downtick. Therefore, none of them could have been compliant short sales under the uptick rule. The first trade on an uptick occurred at 10:30:01 and was at a price of $14.382. Over the eleven second period, the transaction prices ranged from $14.36 to $14.382. A transaction price of $14.37 was sometimes an uptick and sometimes a downtick. In total, of the 211 trades in C, 116 occurred on upticks.

Upbid Rule and C
The national best bid price starts at a downbid of $14.38. The first 16 transactions matched this downbid, so none of them could have been compliant short sales. At 10:30:01, the bid went down again to $14.37. Afterward, two transactions executed at $14.38. Because these transactions were above the bid, they could have been compliant short sales even though the bid was a downbid. Within the same second, the bid went up again to $14.38 with a few other drops to $14.37. Of the first 35 trades, all of which occurred at $14.38, 4 were above a downbid, 15 matched an upbid, and 16 matched a downbid. Therefore, even though the transaction price did not change, 19 of the trades could have been compliant short sales and 16 could not have been.

At 10:30:02, the bid price drops to $14.36. Now, the transaction prices at $14.37 could be compliant short sales. The bid remains at $14.36 until 10:30:08 when it increases to $14.37. While the bid was $14.36 almost all trades executed above $14.36 and could therefore have been compliant short sales. Likewise, after the bid increased back to $14.37, almost all trades executed at or above the upbid, so almost all trades could have been compliant short sales. In total, of the 211 trades, all but 31 could have been compliant short sales.

<u>Example with sequence uncertainty:</u>

As can be observed in the spreadsheets discussed above, many trades and quotes can print during the same second. Therefore, it is fairly unreasonable to assume that traders can observe the exact sequence of trades and quotes at the time of the trade. Therefore, we provide one example of the uncertainty created when traders cannot observe the actual sequence. For simplicity, we assume that the traders can observe the previous second but not the current second. Reality is a bit more complex, but it is unnecessary to illustrate it exactly as it would be in reality.

SEC_OEA_FCIC_001467

Uptick Rule

For this example, we used the C trades and quotes. We now assume that traders do not know the sequence of trades that are printed within a second but may view any subset of the trades within that second. Even without knowing the exact sequence of trades, a trader would know that the first 36 trades at $14.38 would be downticks, and they would also know that the subsequent trades at $14.38 and $14.37 would be on downticks (at least until 10:30:03). It would also be safe for them to assume that the trades at $14.382 were executed on upticks. However, the trade at $14.3782 at 10:30:02 may or may not have been an uptick because there are higher and lower priced trades within that second. The uptick status for the trades at 10:30:03 are fairly uncertain. The traders could have observed the downtick at $14.37 at 10:30:02 and decided that $14.37 was also a downtick at 10:30:03. However, the traders could have observed the trade at $14.3676 prior to setting the $14.37 price, making it an uptick. In total, 91 of the 211 trades would have an uncertain tick status and 49 would have been definite upticks.

Upbid Rule

Under the uptick rule, the sequence of trades within the second matter, but with the upbid rule, it is the sequence of bids. We now assume that traders observe the last bid in the previous second and may observe any subset of the bids in the concurrent second. At 10:30:00, there is only one bid observation, a downbid, so there is no uncertainty about short sale compliance. At 10:30:01, however, there is a downbid of $14.38, a downbid of $14.37, and a potential upbid of $14.38. Therefore, we do not know which bid the traders executing the trades at $14.38 observe. If they observe the downbid of $14.37 or the upbid of $14.38 then the $14.38 transaction price could be a compliant short sale. However, if they observe the downbid of $14.38, then the transactions would not be compliant short sales. In total, 48 of the 211 transactions would have an uncertain status under the upbid rule.

Overview of the Elimination of Rule 10a-1 (The Uptick Rule)

Office of Economic Analysis

Historical Background

- The uptick rule was originally adopted by the SEC in 1938 with very little supporting evidence. The Commission study used to justify the rule was based on two weeks of transactions data from 20 securities, and found simply that short sales constituted a significant portion of the total volume during a period when the market declined. The idea of having a tick-based restriction on short selling goes back to a rule adopted by the NYSE in 1931. The adoption of earlier rule by the NYSE appears to have been motivated by a desire to head off potential action by Congress to impose more severe restrictions on short selling.

- The Commission, in the Special Study in 1963 and subsequently, has recognized that the uptick rule was not effective and not necessary. For example, in a 1976 release, the Commission stated that "it appears… that certain of the major manipulative practices intended to be remedied by short sale regulation of the type currently in effect no longer do, or could, afflict today's market in the same manner they did in the period prior to the adoption of the existing market regulatory framework."

- In the aftermath of the 1987 market crash, economists on the Commission staff and outside the Commission evaluated the uptick rule. They concluded that the uptick rule may have exacerbated the disconnect between equity and equity futures markets during the crash, and that there was no good justification for maintaining the uptick rule.[1]

Why the Uptick Rule was Ineffective and Harmful

- Numerous economic studies since 1963 by Commission staff and independent researchers have found the uptick rule was not effective or not necessary. These are summarized in the literature review section beginning on page 16 of OEA's Reg SHO Pilot study.

- A large number of academic studies show that restrictions on short selling can harm market efficiency, price discovery, and liquidity. Studies have also shown that restricting short selling leads to higher volatility and more negative skewness in stock returns, leading to an increase rather than a decrease in the frequency of large price declines.

[1] See Macey, Mitchell, and Netter, Restrictions on Short Sales: An Analysis of the Uptick Rule and its Role in View of the October 1987 Stock Market Crash, Cornell Law Review Vol 74: 799-835.

- The introduction and explosive growth of derivative securities markets including options, futures, equity swaps, and other OTC products gave investors alternative ways to sell short that are not subject to the uptick rule. Unequal regulation in economically equivalent markets can distort investors' decisions, and is inconsistent with a goal articulated by the President's Working Group on Financial Markets since 1989 advocating coordinated rules across markets.

- Investors who wish to sell into a falling market can circumvent an uptick rule simply by using a dealer as an intermediary. The short seller simply sells to the dealer on an uptick, the dealer legally sells on a downtick, and the dealer recovers the trading loss through the sales commission. The cost of circumventing the rule in this manner declined significantly when the tick size decreased to one penny.

- The uptick rule can create new incentives for market manipulation. In particular, when short sale market orders are in a system with an uptick rule and their execution is delayed because they cannot be immediately executed at the bid, these market orders wait in the system until they can be executed. At such a time, a market manipulator who is long in the stock can make money by dumping shares on the market to push down the price, and then turn around and buy back the shares from the standing short-sale market orders.

- The uptick rule created a situation where NYSE specialists had an informational advantage relative to other market participants. This was because the specialist had unique ability to observe whether incoming sell orders were marked short. This information could enable the specialists to better assess whether incoming order flow was coming from sophisticated traders.

Elimination of the Uptick Rule: Process and Timing

- The process that led up to the elimination of Rule 10a-1 was an extremely careful, deliberative rulemaking process, carried out in multiple stages from 1999 through 2006, open for public comment at every stage. The process was hailed by multiple Commissioners as a model of how rulemaking should occur at the Commission.

    - 1999 Concept Release
    - 2003 Reg SHO Proposing Release
    - 2004 Reg SHO Adopting Release
    - 2006 Roundtable on SHO Pilot
    - OEA Analysis of Reg SHO Pilot
    - 2007 Amendments eliminating Rule 10a-1

- Rule 10a-1 only applied to exchange-listed stocks, never to Nasdaq stocks, but when Nasdaq applied to become an exchange, the Commission had to reconsider

the effects of the uptick rule. If the Commission had taken no action to change Rule 10a-1, the rule would have expanded to all Nasdaq stocks when Nasdaq became an exchange. This would have required significant implementation and compliance costs for those trading platforms such as ECNs that were trading only Nasdaq stocks and were operating without an uptick rule.

- When the Commission was considering eliminating the uptick rule, stock exchanges, ECNs and other trading systems, and brokers were in the middle of reprogramming their systems to comply with Regulation NMS. The industry needed timely resolution from the Commission on whether the uptick rule would be removed, because they needed to know whether to program it into their systems. This was one of the drivers of the timing of the Commission's decision.

- Prior to eliminating Rule 10a-1, the Commission eliminated the rule on a Pilot basis for approximately 1/3 of the stocks in the Russell 3000. To allow the public and the Commission staff to study the effects of eliminating the rule, special new data were made publicly available during the Pilot period. Commission staff and multiple groups of independent researchers studied the effects of eliminating the rule. The results of independent researchers were presented and discussed in a public Roundtable in September 2006. The results of the Commission staff study were made publicly available in Draft form in September 2006 and in final form in February 2007.

- The OEA pilot study has been criticized on the basis that it was conducted during a period when the market was not significantly declining and therefore is not informative about the effects of the uptick rule during market declines. However, the uptick rule applied to the trading of individual securities, not the market as a whole, and many of the individual securities in the pilot experienced episodes of significant price declines. For example, the period studied by OEA contained a short period of high uncertainty about stocks affected by Hurricane Katrina. In the stocks affected, those with an uptick rule did not differ then those without an uptick rule.

- When the Commission voted to eliminate the uptick rule, it was informed not only by the OEA pilot study, but by a large body of evidence, including research conducted by both OEA staff economists and independent researchers, and including studies conducted in periods with varying market conditions. Some of the earlier studies on which the Commission based its decision were focused on periods of general market decline.

Current Situation

- With the advent of the subprime mortgage crisis and credit crisis in 2007, market volatility increased markedly in every major stock market around the world.

Major developments in the credit crisis occurred in late July 2007, just weeks after the elimination of the uptick rule. OEA is not aware of any evidence that the final elimination of the uptick rule contributed to higher worldwide market volatility. Volatility increases were similar in the U.S. for stocks that were subject to Rule 10a-1 and those that were not, and volatility increases were also observed in countries that still have an uptick rule. OEA's pilot study showed that eliminating the uptick rule was associated with lower volatility for larger stocks and higher volatility for smaller stocks.

- Our understanding is that most markets today, including NYSE, are not using trading technologies that could incorporate an uptick rule or a bid test without systems reprogramming. Should the Commission choose to reinstate any form of tick test, we believe that implementation and compliance costs would be quite high.

- Some have suggested the possibility of allowing certain exchanges to reintroduce the tick test on a voluntary basis. This may present difficulties with Regulation NMS. Specifically, Rule 611 under Reg NMS (the Order Protection Rule) prohibits markets from trading through (trading at a worse price than) automated quotations on other markets. If one or more exchanges were to implement a tick test, their bid quotes would no longer appear to satisfy the definition of "automated quotation" as defined in Rule 600(b)-3. The bid quotes from such exchanges would presumably have to be marked "manual" and the bids on exchanges with an uptick rule would no longer receive trade-through protection. It is not clear the exchanges would still want to introduce a bid test if it meant their quote would no longer be protected. Reg NMS could be modified or amended, but this might raise other complications for the operation of the rule.

- The SEC has received comments and complaints suggesting the uptick rule should be reinstated. Some of these comments mention its circuit breaker function or its ability to stop bear raids. This topic was discussed at length at the Roundtable on the Regulation SHO Pilot. Participants observed that pump-and-dump manipulation attempts are far more prevalent than bear raid attempts. Because short sellers combat upward manipulations, removing the uptick rule is likely to reduce rather than increase market manipulation. In addition, the panelists at the roundtable noted that the uptick rule is a poor choice of circuit breaker. Studies have shown that even when the tick size was $1/8^{th}$, the uptick rule only caused a moderate delay in trade executions for short sales. The delay was even shorter after decimalization.

- The question has been raised in congressional hearings and elsewhere as to whether the Commission is considering reinstating the uptick rule, perhaps with an uptick increment larger than one penny. OEA has not seen any new evidence that would indicate that reinstating any form of the uptick rule would be

consistent with the goals of the Commission, nor is OEA aware of any specific proposals of how such a rule would be structured. Actively traded stocks today frequently have a bid ask spread of only one penny. If an uptick rule were imposed with an increment larger than one penny, the threshold price for a short sale execution would often be above the ask price, in which case a short sale could not be executed anywhere at or inside the quoted spread. Given that Reg NMS prohibits trading outside the NBBO, this would amount to a *de facto* prohibition on short selling.

To illustrate, the following graph shows the how a hypothetical five-penny uptick rule would have operated for Intel Stock during the first hour of trading on December 31, 2007. The bottom two lines show the evolution of the bid ask spread. The top, yellow line shows the last trade price plus five cents. If a rule required that a trade be executed five cents above the previous trade price, the minimum threshold trade price for executing short sales would have been significantly higher than the ask all day.

Subject: Bullet points on the uptick rule

My concern about your proposed language is that it seems to imply that the OEA study found evidence of bear raids that the tick test didn't stop.

Attached are some bullet points you may find useful.

Bullet
s_10_7_08.doc (

Here is some additional text describing the Commission's historical view of the purpose of the tick test.

The Commission's Special Study (1963) identified three objectives of the tick test, which have been consistently used by the Commission as a framework for discussing the effectiveness of the regulation. These objectives are that the rule should:

(1) Allow relatively unrestricted short sales in an advancing market;

(2) Prevent short selling at successively lower prices, thus eliminating short selling as a tool for driving the market down; and

(3) Prevent short sellers from accelerating a declining market by exhausting all remaining bids at one price level, causing successively lower prices to be established by long sellers.

The 1963 Special study and numerous subsequent studies found that the uptick rule was not effective at achieving these objectives.

Overview of the Elimination of Rule 10a-1 (The Uptick Rule)

Office of Economic Analysis

Historical Background

- The uptick rule was originally adopted by the SEC in 1938 with very little supporting evidence. The Commission study used to justify the rule was based on two weeks of transactions data from 20 securities, and found simply that short sales constituted a significant portion of the total volume during a period when the market declined. The idea of having a tick-based restriction on short selling goes back to a rule adopted by the NYSE in 1931. The adoption of earlier rule by the NYSE appears to have been motivated by a desire to head off potential action by Congress to impose more severe restrictions on short selling.

- The Commission, in the Special Study in 1963 and subsequently, has recognized that the uptick rule was not effective and not necessary. For example, in a 1976 release, the Commission stated that "it appears… that certain of the major manipulative practices intended to be remedied by short sale regulation of the type currently in effect no longer do, or could, afflict today's market in the same manner they did in the period prior to the adoption of the existing market regulatory framework."

- In the aftermath of the 1987 market crash, economists on the Commission staff and outside the Commission evaluated the uptick rule. They concluded that the uptick rule may have exacerbated the disconnect between equity and equity futures markets during the crash, and that there was no good justification for maintaining the uptick rule.[1]

Why the Uptick Rule was Ineffective and Harmful

- Numerous economic studies since 1963 by Commission staff and independent researchers have found the uptick rule was not effective or not necessary. These are summarized in the literature review section beginning on page 16 of OEA's Reg SHO Pilot study.

- A large number of academic studies show that restrictions on short selling can harm market efficiency, price discovery, and liquidity. Studies have also shown that restricting short selling leads to higher volatility and more negative skewness in stock returns, leading to an increase rather than a decrease in the frequency of large price declines.

[1] See Macey, Mitchell, and Netter, Restrictions on Short Sales: An Analysis of the Uptick Rule and its Role in View of the October 1987 Stock Market Crash, Cornell Law Review Vol 74: 799-835.

- The introduction and explosive growth of derivative securities markets including options, futures, equity swaps, and other OTC products gave investors alternative ways to sell short that are not subject to the uptick rule. Unequal regulation in economically equivalent markets can distort investors' decisions, and is inconsistent with a goal articulated by the President's Working Group on Financial Markets since 1989 advocating coordinated rules across markets.

- Investors who wish to sell into a falling market can circumvent an uptick rule simply by using a dealer as an intermediary. The short seller simply sells to the dealer on an uptick, the dealer legally sells on a downtick, and the dealer recovers the trading loss through the sales commission. The cost of circumventing the rule in this manner declined significantly when the tick size decreased to one penny.

- The uptick rule can create new incentives for market manipulation. In particular, when short sale market orders are in a system with an uptick rule and their execution is delayed because they cannot be immediately executed at the bid, these market orders wait in the system until they can be executed. At such a time, a market manipulator who is long in the stock can make money by dumping shares on the market to push down the price, and then turn around and buy back the shares from the standing short-sale market orders.

- The uptick rule created a situation where NYSE specialists had an informational advantage relative to other market participants. This was because the specialist had unique ability to observe whether incoming sell orders were marked short. This information could enable the specialists to better assess whether incoming order flow was coming from sophisticated traders.

Elimination of the Uptick Rule: Process and Timing

- The process that led up to the elimination of Rule 10a-1 was an extremely careful, deliberative rulemaking process, carried out in multiple stages from 1999 through 2006, open for public comment at every stage. The process was hailed by multiple Commissioners as a model of how rulemaking should occur at the Commission.

    - 1999 Concept Release
    - 2003 Reg SHO Proposing Release
    - 2004 Reg SHO Adopting Release
    - 2006 Roundtable on SHO Pilot
    - OEA Analysis of Reg SHO Pilot
    - 2007 Amendments eliminating Rule 10a-1

- Rule 10a-1 only applied to exchange-listed stocks, never to Nasdaq stocks, but when Nasdaq applied to become an exchange, the Commission had to reconsider

the effects of the uptick rule. If the Commission had taken no action to change Rule 10a-1, the rule would have expanded to all Nasdaq stocks when Nasdaq became an exchange. This would have required significant implementation and compliance costs for those trading platforms such as ECNs that were trading only Nasdaq stocks and were operating without an uptick rule.

- When the Commission was considering eliminating the uptick rule, stock exchanges, ECNs and other trading systems, and brokers were in the middle of reprogramming their systems to comply with Regulation NMS. The industry needed timely resolution from the Commission on whether the uptick rule would be removed, because they needed to know whether to program it into their systems. This was one of the drivers of the timing of the Commission's decision.

- Prior to eliminating Rule 10a-1, the Commission eliminated the rule on a Pilot basis for approximately 1/3 of the stocks in the Russell 3000. To allow the public and the Commission staff to study the effects of eliminating the rule, special new data were made publicly available during the Pilot period. Commission staff and multiple groups of independent researchers studied the effects of eliminating the rule. The results of independent researchers were presented and discussed in a public Roundtable in September 2006. The results of the Commission staff study were made publicly available in Draft form in September 2006 and in final form in February 2007.

- The OEA pilot study has been criticized on the basis that it was conducted during a period when the market was not significantly declining and therefore is not informative about the effects of the uptick rule during market declines. However, the uptick rule applied to the trading of individual securities, not the market as a whole, and many of the individual securities in the pilot experienced episodes of significant price declines. For example, the period studied by OEA contained a short period of high uncertainty about stocks affected by Hurricane Katrina. In the stocks affected, those with an uptick rule did not differ then those without an uptick rule.

- When the Commission voted to eliminate the uptick rule, it was informed not only by the OEA pilot study, but by a large body of evidence, including research conducted by both OEA staff economists and independent researchers, and including studies conducted in periods with varying market conditions. Some of the earlier studies on which the Commission based its decision were focused on periods of general market decline.

Current Situation

- With the advent of the subprime mortgage crisis and credit crisis in 2007, market volatility increased markedly in every major stock market around the world.

Major developments in the credit crisis occurred in late July 2007, just weeks after the elimination of the uptick rule. OEA is not aware of any evidence that the final elimination of the uptick rule contributed to higher worldwide market volatility. Volatility increases were similar in the U.S. for stocks that were subject to Rule 10a-1 and those that were not, and volatility increases were also observed in countries that still have an uptick rule. OEA's pilot study showed that eliminating the uptick rule was associated with lower volatility for larger stocks and higher volatility for smaller stocks.

- Our understanding is that most markets today, including NYSE, are not using trading technologies that could incorporate an uptick rule or a bid test without systems reprogramming. Should the Commission choose to reinstate any form of tick test, we believe that implementation and compliance costs would be quite high.

- Some have suggested the possibility of allowing certain exchanges to reintroduce the tick test on a voluntary basis. This may present difficulties with Regulation NMS. Specifically, Rule 611 under Reg NMS (the Order Protection Rule) prohibits markets from trading through (trading at a worse price than) automated quotations on other markets. If one or more exchanges were to implement a tick test, their bid quotes would no longer appear to satisfy the definition of "automated quotation" as defined in Rule 600(b)-3. The bid quotes from such exchanges would presumably have to be marked "manual" and the bids on exchanges with an uptick rule would no longer receive trade-through protection. It is not clear the exchanges would still want to introduce a bid test if it meant their quote would no longer be protected. Reg NMS could be modified or amended, but this might raise other complications for the operation of the rule.

- The SEC has received comments and complaints suggesting the uptick rule should be reinstated. Some of these comments mention its circuit breaker function or its ability to stop bear raids. This topic was discussed at length at the Roundtable on the Regulation SHO Pilot. Participants observed that pump-and-dump manipulation attempts are far more prevalent than bear raid attempts. Because short sellers combat upward manipulations, removing the uptick rule is likely to reduce rather than increase market manipulation. In addition, the panelists at the roundtable noted that the uptick rule is a poor choice of circuit breaker. Studies have shown that even when the tick size was $1/8^{th}$, the uptick rule only caused a moderate delay in trade executions for short sales. The delay was even shorter after decimalization.

- The question has been raised in congressional hearings and elsewhere as to whether the Commission is considering reinstating the uptick rule, perhaps with an uptick increment larger than one penny. OEA has not seen any new evidence that would indicate that reinstating any form of the uptick rule would be

consistent with the goals of the Commission, nor is OEA aware of any specific proposals of how such a rule would be structured. Actively traded stocks today frequently have a bid ask spread of only one penny. If an uptick rule were imposed with an increment larger than one penny, the threshold price for a short sale execution would often be above the ask price, in which case a short sale could not be executed anywhere at or inside the quoted spread. Given that Reg NMS prohibits trading outside the NBBO, this would amount to a *de facto* prohibition on short selling.

MEMORANDUM

TO: DISTRIBUTION LIST

FROM: OEA

SUBJECT: INITIAL ANALYSIS OF PILOT STOCKS ON FEBRUARY 27TH, 2007

DATE: 4/9/2007

At last September's Roundtable on the Regulation SHO Pilot, several panelists noted that the pilot period had not provided an opportunity to study the efficacy of the short sale price tests during large market declines.[1] A few Commissioners echoed these sentiments at the December 4th, 2006, open meeting to propose the removal of Rule 10a-1 and similar SRO rules.

On February 27th, 2007, the Dow Industrial Average fell 3.3%, the largest single-day percentage market decline since March 2003. In addition, the point drop on the Dow (416.02) was the seventh biggest single-day point drop ever and the biggest loss since September 17, 2001. Further, a few technological glitches on February 27th created a panic atmosphere toward the end of the trading day. This large single-day decline gives us an opportunity to study the effect of the Regulation SHO Pilot under unusually "bearish" market conditions. Indeed, one commenter implied that the Pilot was responsible for the market decline.[2] We took advantage of this opportunity and summarize our initial analysis in this memo.

SUMMARY OF THE FINDINGS

We focus our analysis on the daily returns for the stocks included in the Regulation SHO Pilot, which are not subject to any price test rule, and a group of Control stocks, which are subject to price test rules. Our goal is to learn additional information about the potential effect of adopting the proposal to remove price test rules during periods of market stress.[3] Specifically, we find that the absence of Rule 10a-1 and the Nasdaq Bid Test did not result in significantly lower returns on February 27th, 2007. Therefore, the results of our analysis suggest that February 27th, 2007 provides no new evidence opposing the adoption of the proposal. Specific results include:

- The price test rules did not protect stocks from negative returns.
    - Almost 99% of NYSE and Amex stocks and 97% of Nasdaq Global and Global Select stocks had negative returns on February 27th. A smaller percentage of Pilot stocks had negative returns than Control stocks.
- The absence of a price test rule did not result in larger price declines.

[1] See the Roundtable transcript (http://www.sec.gov/about/economic/shopilottrans091506.pdf), for example, the comments of Frank Hatheway (p. 27), Paul Irvine (pp.54-56), and Pete Kyle (p. 121).
[2] See comment from Bruce Thompson on February 28, 2007: http://www.sec.gov/comments/s7-21-06/bthompson8357.htm. This comment seems to be largely based on a quote by Jim Cramer.
[3] See Release No. 34-54891, File No. S7-21-06: http://www.sec.gov/rules/proposed/2006/34-54891.pdf.

  - The Pilot stocks on NYSE and Amex under-performed the Control stocks by 6 bps on February 27th. Tests reveal that this 6 bps is not statistically significant.

  - The Pilot stocks on Nasdaq under-performed the Control stocks by about half a basis point. This half a basis point is not statistically significant.

- We examined the robustness of these results, but found no cause for concern.

  - We determined that there is no longer a good control sample for the Nasdaq 100.[4]

  - When we exclude the Nasdaq 100 stocks, Pilot stocks under-perform the Control stocks by 0.6 bps, but this difference is not statistically significant.

  - Some NYSE stocks experienced a computer capacity glitch toward the end of the day. Examining only those stocks that were not affected by the glitch, we find that Pilot stocks underperformed the Control stocks by about 32 basis points. This difference is not statistically significant.

- We examined whether small stocks are affected more by price test rules, and found that the absence of a price test restriction does not adversely affect small stocks during periods of market stress.

  - We found that our smallest Pilot stocks, by market capitalization, did not under-perform the smallest Control stocks.

ANALYSIS

Samples

We collected closing prices for February 26th and 27th and shares outstanding for February 26th for all stocks from Data Stream. We merged this data with the Pilot stock lists posted by Amex, Nasdaq, and NYSE in the evening of February 26th. In addition, we merged the data with a Control sample constructed as follows. We started with the Control sample used in the OEA Pilot Report and tracked ticker symbol changes, delistings, and mergers. While allowing ticker symbols to change, we kept those stocks that were listed on Amex, Nasdaq Global or Global Select, or NYSE as of February 27th. Our Pilot sample consisted of 463 stocks listed on NYSE or Amex and 454 stocks listed on Nasdaq. Our Control sample consisted of 877 NYSE or Amex stocks subject to Rule 10a-1 and 723 Nasdaq stocks subject to the Bid Test. Because the short sale rule applied to NYSE and Amex stocks is different from the rule applied to Nasdaq stocks, we keep these stocks separate throughout our analysis.

Returns

We estimate returns as the percentage price change from the February 26th close to the February 27th close. Table 1 shows the number and percentage of Pilot and Control stocks that declined in price. Over 95% of our sample stocks declined on February 27th. The percentage of Pilot stocks declining is slightly lower than the percentage of Control stocks declining. However, the numbers appear fairly similar. For Amex and NYSE stocks, 98.7% of Pilot stocks had negative returns while 98.86% of Control stocks had

[4] In other words, if market capitalization affected returns on February 27, 2007, the Nasdaq Control group may not accurately control for all confounding effects.

SEC_OEA_FCIC_001483

negative returns. The difference was a bit larger for Nasdaq stocks as 96.70% of Pilot stocks declined to the 96.96% of Control stocks. However the difference is still very small. We can reject the hypothesis that more Pilot stocks declined than Control stocks without estimating a statistical test.

Table 1: Stocks with Price Declines

Listing Market	Sample	# of Stocks Declining	% of Stocks Declining
Amex and NYSE	Pilot	457	98.70%
	Control	867	98.86%
Nasdaq Global or Global Select	Pilot	439	96.70%
	Control	701	96.96%

Because so many stocks declined on this day, we next examine the actual returns to test whether the returns of Pilot stocks were any different than Control stocks. Table 2 shows the average returns and results of a test for the differences between the returns. The average return of NYSE and Amex Pilot stocks was -334 basis points or -3.34%. The average NYSE and Amex Control stock had a return of –328 basis points. The average Pilot stock price declined more than the average control stocks by 6 basis points.

We used a t-test to determine whether the 6 basis point difference is statistically significant. The p-value of the t-test tells us that if the true difference is zero, what is the probability of observing an average difference of -6 basis points or less? Typically, economists do not consider a result statistically significant unless the p-value is less than 0.05. Therefore, the p-value of 0.555 means that the 6 basis points is not statistically significant.

For economic significance, consider the dollar value of one basis point and the end of day transaction costs in the sample stocks. For stocks listed on NYSE and Amex, one basis point is about 0.4¢ per share and the quoted spread at the end of day on February 27th was 13 basis points for Control stocks and 12 basis points for Pilot stocks. One basis point in Nasdaq stocks is about 0.25¢ and the end of day quoted spread was 18 basis points for Control stocks and 12 basis points for Pilot stocks. There is no formal test for economic significance, but the results can be compared to these numbers when judging whether a single figure is large economically. Typically, economic significance is not an issue unless a result is first statistically significant.

For Nasdaq stocks, Pilot stocks had an average return of about -373 basis points, while Control stocks had an average return of -372 basis points. The difference is less than a basis point and is both statistically and economically insignificant.

Table 2: Stock Returns

	Amex and NYSE stocks	Nasdaq Stocks
Pilot Sample	-334 bps	-373 bps
Control Sample	-328 bps	-372 bps
Difference	- 6 bps	-0.5 bps
t-test p-value	0.5550	0.9719

Overall, these results suggest that the application of the price test rules had no effect on the stock market decline of February 27th because the stocks subject to the price test rules declined just as much as

the stocks that are not subject to the price test rules. We next check the reliability of this result by verifying whether the Control stocks are a good match for the Pilot stocks and by categorizing the stocks by institutional details that could influence the results.

Value-weighted Returns

Even though the results thus far show that Pilot stocks did not decline more than Control stocks, we still need to make sure that the Control stocks are a good match for the Pilot stocks. February 27th is over 2 ½ years after the creation of the Pilot sample. We constructed our Control sample at the same time to include stocks that could have been selected for the Pilot. The OEA Pilot report found that the Pilot and Control samples were still statistically similar immediately before the start of the Pilot, almost two years ago. It is reasonable to suspect that the Pilot and Control stocks are no longer as similar as they used to be.

We suspect that market capitalization will give us the best comparison of the samples. Table 3 shows how the average market capitalization of the Pilot stocks differs from the average market capitalization of the Control stocks. The Amex and NYSE Pilot stocks tend to be smaller than the Control stocks. The difference is not statistically significant, but it could be economically important.

The Nasdaq Pilot stocks tend to be much larger than the Nasdaq Control stocks. The difference is both statistically and economically significant. This result could stem from the inclusion of the entire Nasdaq 100 in the Pilot.[5] None of the stocks in the Control sample are as large as the stocks in the Nasdaq 100.

Table 3: Market Capitalization Differences

	Amex and NYSE stocks	Nasdaq Stocks
Pilot Sample	$8.96B	$5.72B
Control Sample	$10.26B	$1.01B
Difference	-$1.3B	***$4.71B***
t-test p-value	0.4132	***<0.0001***

To determine whether the differences in average market capitalization are economically important to our results, we re-estimate the returns for each of our samples weighting by market capitalization. For example, a stock that has a market capitalization of $1B will be weighted ten times more than a stock with a market capitalization of $100M.

Table 4: Stock Returns Weighted by Market Capitalization

	Amex and NYSE stocks	Nasdaq Stocks
Pilot Sample	-338 bps	-401 bps
Control Sample	-329 bps	-360 bps
Difference	- 8 bps	***-41 bps***
t-test p-value	0.2658	***<0.0001***

[5] See Release No. 34-54435, File No. SR-NASDAQ-2006-031: http://www.sec.gov/rules/sro/nasdaq/2006/34-54435.pdf.

Table 4 shows that the NYSE and Amex results do not change much when returns are weighted by market capitalization. The Pilot stocks now under-perform the Control stocks by a statistically insignificant 8 basis points. This figure is still not large enough to be considered economically significant.

The weighted returns tell a different story for Nasdaq stocks. The Pilot stocks now under-perform the control stocks by a statistically and economically significant 41 basis points. Interestingly, because the large stocks are weighted more heavily in the computation, this result suggests that the Nasdaq 100 may have under-performed the smaller Pilot stocks on February 27th.

Results without the Nasdaq 100

The results of the last section show that the Nasdaq Control stocks do not provide a good match for the Nasdaq Pilot stocks and that the difference affects the results. Because the differences between the Pilot and Control stocks are probably due to the inclusion of the Nasdaq 100 in the Pilot sample, we delete the Nasdaq 100 stocks from the Pilot sample and examine whether the Control stocks provide a good match.

After deleting the Nasdaq 100 stocks, we are left with 354 Nasdaq Pilot stocks and 736 Nasdaq Control stocks. Table 5 shows that the market capitalizations of the remaining Nasdaq Pilot stocks are statistically similar to the market capitalizations of the Control stocks. Therefore, the Control stocks do appear to be a good match for the Pilot stocks when the Nasdaq 100 stocks are excluded.

Table 5: Stock Returns Excluding Nasdaq 100

	Market Cap	Unweighted Returns	Weighted Returns
Pilot Sample	$1.03B	-373 bps	-346 bps
Control Sample	$1.01B	-372 bps	-360 bps
Difference	$0.02B	-0.6 bps	14 bps
t-test p-value	0.8056	0.9677	0.2566

Table 5 also re-estimates the differences in the unweighted returns and in the returns weighted by market capitalization. The unweighted return results are almost exactly the same as the unweighted return results in Table 2. The Pilot stocks have average returns that are statistically similar to the average returns of the Control stocks. The weighted returns, however, produce different results. The Pilot stocks now outperform the Control stocks by a statistically insignificant 14 basis points. These results support the conclusion that the Nasdaq Pilot stocks did not under-perform the Nasdaq Control stocks.

Results by stocks affected by the computer capacity glitch

One of the problems faced on February 27th was a queuing of orders on the NYSE toward the end of the trading day. In particular, a subset of specialist posts on the NYSE experienced severe order queuing from about 3pm until after the normal closing. Some of the affected posts closed on time before the queuing problems were resolved, while others remained open until after the queued orders executed.

We examine whether the results for NYSE stocks could be obscured by the glitch toward the end of the trading day. The queuing itself may have slowed down trading enough to mitigate differences between Pilot and Control stocks. Further, the stocks that closed before the queuing was resolved could have closed away from the true value, thus weakening our statistical tests. Therefore, we divide the

NYSE stocks into three categories based on whether they experienced a glitch and whether they closed at the regular time.

To make sure that the Control stocks are still similar to the Pilot stocks even after dividing them this way, we first estimate the average market capitalization of each of these groups. Of the 1,299 NYSE stocks in the sample, 233 did not experience the computer capacity glitch.[6] These are the stocks for which trading itself was not delayed and, therefore, where any effects of the absence of the tick test would be most pronounced. Another 344 stocks had the glitch but closed on time (we define stocks as closing on time if they closed before 4:01:30).[7] These stocks may have closed before the capacity problem was resolved and therefore, the closing prices might not reflect the true end of day balance of buying and selling interest.

The final 732 stocks experienced the computer capacity glitch but closed after the glitch was resolved. The closing price should reflect all entered buying and selling interest but the glitch itself may have obscured any effect of the absence of the tick test. Despite closing after the resolution of the glitch, the prices of these stocks may have additional problems if traders wondering if orders were lost, entered those orders more than once. If either buy or sell orders are more likely to be entered more than once, the closing price will not reflect the true buying and selling interest in the stock. Therefore, the sample that will inform us the most about the effect of the tick test is the sample of stocks that did not experience a glitch.

The Pilot stocks make up about 31 to 39% of the stocks in each of these groups: the no glitch group has 87 Pilot stocks, the glitch group that closed on time has 127 Pilot stocks, and the glitch group that closed late has 233 Pilot stocks. Table 6 shows the market capitalizations of the Pilot and Control stocks in each of the three sub-groups. For the no glitch group, the average market capitalizations of the pilot and control groups are statistically similar. The same is true for the glitch stocks with a late close. The Control stocks in the glitch group that closed on time are much larger than the Pilot stocks in the same group. Therefore, the Control stocks are not a very good match for the Pilot stocks in this category.

Table 6: Market Capitalization Controlling for Computer Capacity Glitch and Closing Time

	No Glitch	Glitch – Regular Close	Glitch – Late Close
Pilot Sample	$10.76B	$5.87B	$10.54B
Control Sample	$9.06B	$13.20B	$9.51B
Difference	$1.7B	***$7.33B***	$1.03B
t-test p-value	0.6950	***0.0345***	0.6026

To examine the effect of the tick test, Table 7 shows the daily returns for each of the subgroups and the results of a t-test for the difference between the Pilot and Control stocks. The Pilot stocks that did not experience a glitch underperformed the Control stocks by 32 basis points, but this number is not statistically significant.

For the glitch stocks, the results differ by the timing of the close. For the stocks that closed on time, the Pilot stocks outperformed the Control stocks by 38 basis points. This result is not statistically

[6] Apparently, post numbers 1 to 12 had the capacity glitch. We collected the post number for each of our sample stocks from the TAQ master file for February 27, 2007 obtained from NYSEdata.com.

[7] Closing times are from the last NYSE closing quote print the TAQ quote file for February 27, 2007 obtained from NYSEdata.com.

significant, though the p-value is just insignificant. This result should be taken with extreme caution for two reasons. First, the stocks' closing prices may not reflect all buying and selling interest. Second, because Table 6 above suggests that the Control stocks may not be a good match for the Pilot stocks, the result may be driven by differences in the characteristics of the stocks in the two groups rather than the difference in price test application.

Table 7: Stock Returns Controlling for Capacity Glitch and Closing Time

	No Glitch	Glitch – Regular Close	Glitch – Late Close
Pilot Sample	-345 bps	-301 bps	-352 bps
Control Sample	-313 bps	-339 bps	-328 bps
Difference	-32 bps	38 bps	-24 bps
t-test p-value	0.2399	0.0537	0.0627

The late closing Pilot stocks experiencing the glitch underperformed the Control stocks in the same group by 24 basis points. This result is also statistically insignificant but the p-value is close to the 0.05 significance criteria. As indicated above, this result on its surface cannot be interpreted with much confidence because the prices might reflect orders that are executed multiple times. Therefore, we cannot attribute these results solely to the Pilot.

Despite the inability to interpret what the results for the glitch stocks tell us about the Regulation SHO Pilot, we can use the results to illustrate the importance of focusing only on the sample that did not experience a glitch. The glitch clearly could have obscured the tests of the Pilot. By removing the stocks that had capacity problems toward the end of the day, we can better isolate the effect of not having a tick test on a high stress day. When isolating this effect, we can conclude that the tick test had little effect on returns.

Small Stocks

Several commenters expressed concern about removing Rule 10a-1 and the Bid Test from smaller stocks. To examine whether the absence of a price test rule affected small stocks in a harmful way, we re-ran the above tests focusing only on small stocks. First, we separated all of the sample stocks into ten groups by market capitalization. The groupings were made without regard to Pilot status or listing market. We then removed the Nasdaq 100 stocks, separated the stocks into groups by listing market, and re-ran our tests.

Table 8 shows the results for the smallest group of stocks only. The smallest group consists of 19 Pilot stocks listed on the NYSE and Amex, 36 Control stocks listed on the NYSE and Amex, 56 Pilot stocks listed on Nasdaq, and 140 Control stocks listed on Nasdaq. For both markets, the Pilot sample experienced higher returns than the Control sample, but the difference was not statistically significant.

Table 8: Stock Returns for the Smallest Stocks

	Amex and NYSE Stocks	Nasdaq Stocks
Pilot Sample	-279 bps	-309 bps
Control Sample	-361 bps	-334 bps
Difference	82 bps	24 bps
t-test p-value	0.3488	0.6200

We also re-estimated the test for each of the other size groups. Only one NYSE and Amex size group and only one Nasdaq size group showed results that support the hypothesis that Pilot stocks under-performed Control stocks. Both of these groups were mid-sized groups. Therefore, the evidence does not suggest that the absence of price test rules harms small stocks during periods of market stress.

Summary and Conclusions

We examine the effect of having a tick test during an unusual market decline by comparing the daily price performance of stocks in the Regulation SHO Pilot to similar stocks that are not in the Pilot ("Control stocks") on February 27th, 2007. Overall, we find that the returns of the Pilot stocks appear slightly lower than the returns of the Control stocks, but the difference is not statistically significant. We verified this result by re-examining the data in several ways. We do not find any other results that are compelling enough to support a different conclusion. Further, the results are similar for small stocks, except that small Pilot stocks are insignificantly higher than small Control stocks. We believe that the conclusions of this analysis provide no new evidence opposing the adoption of the proposal.

We should note that while this market decline of 3.3% on February 27th, 2007 is large by today's standards, it is not large compared to returns experienced in the past. An examination the daily returns in the Dow Industrial Average from January 3, 1900 to February 24, 2006 reveals that the daily return was below -3% on 1.09% of the trading days. This means that on average, each year the Dow experiences almost three trading days of market declines of at least the magnitude experienced on February 27th, 2007.

Further, the relative calm of the pilot period has thus far provided only one large market decline to study. We caution about extrapolating too much based on the results of this one day. The effect of the price test might not be the same on every 3% market decline and might differ when the market declines much more than 3%.

Trading examples applying the uptick rule and modified uptick rule ("upbid rule")

The following spreadsheets provide examples of how the proposed uptick and modified uptick rules would function. The examples include an eleven second snap-shot of an active stock, Citigroup ("C") and a half hour snap shot of a less active stock, Boston Beer ("SAM"). During the periods examined, there were 211 trades and 861 quotes in C and 36 trades and 3,746 quotes in SAM. To figure out the direction of the change in the bid, we constructed an nbbo from the quote sequence in the data. This resulted in 11 nbbo changes in C and 792 nbbo changes in SAM.

How to read the spreadsheets:

The first spreadsheet shows the trades and nbbo quotes in SAM. The first three columns give the *symbol*, *date*, and *time* of the observation (quote or trade). The first observation is at 10:30:05 on October 21, 2008. The next two columns, *price* and *size*, are filled only for trade observations, while the *nbbid* and *nbask* are filled only for quotes (changes in the nbbo). The first observation is a trade for 100 shares at $42.10. The next seven observations are nbbo changes within the same second as the first trade.

The last two columns provide information on the application of the *uptick* and *upbid* rules. The *uptick* column shows the direction of the last change in the transaction price. A "+" indicates an uptick and a "-" indicates a downtick. The *upbid* column shows the direction of the last change in the bid price. A "+" indicates an upbid and a "-" indicates a downbid. By construction the first trade is set to a downtick and the first quote is set to a downbid.

The last two columns also show whether the trade at that price and time could have been a short sale satisfying the uptick or upbid rule. Specifically, the column is shaded in green when the trade would have met the rule.

The applying a rule to trades that have already occurred requires the assumption that the rules would not have changed the sequence of trades and quotes. Based on the Pilot results, we know that this assumption is not true, but the examples can still provide useful illustrations.

We also apply the strong assumption that all market participants can observe the sequence of trades and quotes that are in the spreadsheets prior to the trade. We call this assumption "perfect information." Later, we relax this assumption and call it "sequence uncertainty."

Examples with perfect information:

Uptick Rule and SAM
The uptick rule says that a short sale can only execute at a price that is greater than the last different price. To determine this, we keep track of the price changes and ignore the quotes. The first trade at $42.10 is a downtick by construction, so could not be a short sale. In fact, there are no upticks in SAM until 10:34:02. At this time, a trade at $42.085 creates an uptick and could have been a short sale that complies with the uptick rule. In total, of the 36 trades in SAM, 16 occur on upticks or zero upticks.

SEC_OEA_FCIC_001491

Uptick Rule

For this example, we used the C trades and quotes. We now assume that traders do not know the sequence of trades that are printed within a second but may view any subset of the trades within that second. Even without knowing the exact sequence of trades, a trader would know that the first 36 trades at $14.38 would be downticks, and they would also know that the subsequent trades at $14.38 and $14.37 would be on downticks (at least until 10:30:03). It would also be safe for them to assume that the trades at $14.382 were executed on upticks. However, the trade at $14.3782 at 10:30:02 may or may not have been an uptick because there are higher and lower priced trades within that second. The uptick status for the trades at 10:30:03 are fairly uncertain. The traders could have observed the downtick at $14.37 at 10:30:02 and decided that $14.37 was also a downtick at 10:30:03. However, the traders could have observed the trade at $14.3676 prior to setting the $14.37 price, making it an uptick. In total, 91 of the 211 trades would have an uncertain tick status and 49 would have been definite upticks.

Upbid Rule

Under the uptick rule, the sequence of trades within the second matter, but with the upbid rule, it is the sequence of bids. We now assume that traders observe the last bid in the previous second and may observe any subset of the bids in the concurrent second. At 10:30:00, there is only one bid observation, a downbid, so there is no uncertainty about short sale compliance. At 10:30:01, however, there is a downbid of $14.38, a downbid of $14.37, and a potential upbid of $14.38. Therefore, we do not know which bid the traders executing the trades at $14.38 observe. If they observe the downbid of $14.37 or the upbid of $14.38 then the $14.38 transaction price could be a compliant short sale. However, if they observe the downbid of $14.38, then the transactions would not be compliant short sales. In total, 48 of the 211 transactions would have an uncertain status under the upbid rule.

Subject: Bullet points on the uptick rule

My concern about your proposed language is that it seems to imply that the OEA study found evidence of bear raids that the tick test didn't stop.

Attached are some bullet points you may find useful.

Bullet
s_10_7_08.doc (

Here is some additional text describing the Commission's historical view of the purpose of the tick test.

The Commission's Special Study (1963) identified three objectives of the tick test, which have been consistently used by the Commission as a framework for discussing the effectiveness of the regulation. These objectives are that the rule should:

(1) Allow relatively unrestricted short sales in an advancing market;

(2) Prevent short selling at successively lower prices, thus eliminating short selling as a tool for driving the market down; and

(3) Prevent short sellers from accelerating a declining market by exhausting all remaining bids at one price level, causing successively lower prices to be established by long sellers.

The 1963 Special study and numerous subsequent studies found that the uptick rule was not effective at achieving these objectives.

Office of Economic Analysis

Overview of the Elimination of Rule 10a-1 (The Uptick Rule)

Office of Economic Analysis

Historical Background

- The uptick rule was originally adopted by the SEC in 1938 with very little supporting evidence. The Commission study used to justify the rule was based on two weeks of transactions data from 20 securities, and found simply that short sales constituted a significant portion of the total volume during a period when the market declined. The idea of having a tick-based restriction on short selling goes back to a rule adopted by the NYSE in 1931. The adoption of earlier rule by the NYSE appears to have been motivated by a desire to head off potential action by Congress to impose more severe restrictions on short selling.

- The Commission, in the Special Study in 1963 and subsequently, has recognized that the uptick rule was not effective and not necessary. For example, in a 1976 release, the Commission stated that "it appears... that certain of the major manipulative practices intended to be remedied by short sale regulation of the type currently in effect no longer do, or could, afflict today's market in the same manner they did in the period prior to the adoption of the existing market regulatory framework."

- In the aftermath of the 1987 market crash, economists on the Commission staff and outside the Commission evaluated the uptick rule. They concluded that the uptick rule may have exacerbated the disconnect between equity and equity futures markets during the crash, and that there was no good justification for maintaining the uptick rule.[1]

Why the Uptick Rule was Ineffective and Harmful

- Numerous economic studies since 1963 by Commission staff and independent researchers have found the uptick rule was not effective or not necessary. These are summarized in the literature review section beginning on page 16 of OEA's Reg SHO Pilot study.

- A large number of academic studies show that restrictions on short selling can harm market efficiency, price discovery, and liquidity. Studies have also shown that restricting short selling leads to higher volatility and more negative skewness in stock returns, leading to an increase rather than a decrease in the frequency of large price declines.

[1] See Macey, Mitchell, and Netter, Restrictions on Short Sales: An Analysis of the Uptick Rule and its Role in View of the October 1987 Stock Market Crash, Cornell Law Review Vol 74: 799-835.

the effects of the uptick rule. If the Commission had taken no action to change Rule 10a-1, the rule would have expanded to all Nasdaq stocks when Nasdaq became an exchange. This would have required significant implementation and compliance costs for those trading platforms such as ECNs that were trading only Nasdaq stocks and were operating without an uptick rule.

- When the Commission was considering eliminating the uptick rule, stock exchanges, ECNs and other trading systems, and brokers were in the middle of reprogramming their systems to comply with Regulation NMS. The industry needed timely resolution from the Commission on whether the uptick rule would be removed, because they needed to know whether to program it into their systems. This was one of the drivers of the timing of the Commission's decision.

- Prior to eliminating Rule 10a-1, the Commission eliminated the rule on a Pilot basis for approximately 1/3 of the stocks in the Russell 3000. To allow the public and the Commission staff to study the effects of eliminating the rule, special new data were made publicly available during the Pilot period. Commission staff and multiple groups of independent researchers studied the effects of eliminating the rule. The results of independent researchers were presented and discussed in a public Roundtable in September 2006. The results of the Commission staff study were made publicly available in Draft form in September 2006 and in final form in February 2007.

- The OEA pilot study has been criticized on the basis that it was conducted during a period when the market was not significantly declining and therefore is not informative about the effects of the uptick rule during market declines. However, the uptick rule applied to the trading of individual securities, not the market as a whole, and many of the individual securities in the pilot experienced episodes of significant price declines. For example, the period studied by OEA contained a short period of high uncertainty about stocks affected by Hurricane Katrina. In the stocks affected, those with an uptick rule did not differ then those without an uptick rule.

- When the Commission voted to eliminate the uptick rule, it was informed not only by the OEA pilot study, but by a large body of evidence, including research conducted by both OEA staff economists and independent researchers, and including studies conducted in periods with varying market conditions. Some of the earlier studies on which the Commission based its decision were focused on periods of general market decline.

Current Situation

- With the advent of the subprime mortgage crisis and credit crisis in 2007, market volatility increased markedly in every major stock market around the world.

consistent with the goals of the Commission, nor is OEA aware of any specific proposals of how such a rule would be structured. Actively traded stocks today frequently have a bid ask spread of only one penny. If an uptick rule were imposed with an increment larger than one penny, the threshold price for a short sale execution would often be above the ask price, in which case a short sale could not be executed anywhere at or inside the quoted spread. Given that Reg NMS prohibits trading outside the NBBO, this would amount to a *de facto* prohibition on short selling.

To illustrate, the following graph shows the how a hypothetical five-penny uptick rule would have operated for Intel Stock during the first hour of trading on December 31, 2007. The bottom two lines show the evolution of the bid ask spread. The top, yellow line shows the last trade price plus five cents. If a rule required that a trade be executed five cents above the previous trade price, the minimum threshold trade price for executing short sales would have been significantly higher than the ask all day.

MEMORANDUM

TO: DISTRIBUTION LIST

FROM: OEA

SUBJECT: INITIAL ANALYSIS OF PILOT STOCKS ON FEBRUARY 27TH, 2007

DATE: 4/9/2007

At last September's Roundtable on the Regulation SHO Pilot, several panelists noted that the pilot period had not provided an opportunity to study the efficacy of the short sale price tests during large market declines.[1] A few Commissioners echoed these sentiments at the December 4th, 2006, open meeting to propose the removal of Rule 10a-1 and similar SRO rules.

On February 27th, 2007, the Dow Industrial Average fell 3.3%, the largest single-day percentage market decline since March 2003. In addition, the point drop on the Dow (416.02) was the seventh biggest single-day point drop ever and the biggest loss since September 17, 2001. Further, a few technological glitches on February 27th created a panic atmosphere toward the end of the trading day. This large single-day decline gives us an opportunity to study the effect of the Regulation SHO Pilot under unusually "bearish" market conditions. Indeed, one commenter implied that the Pilot was responsible for the market decline.[2] We took advantage of this opportunity and summarize our initial analysis in this memo.

SUMMARY OF THE FINDINGS

We focus our analysis on the daily returns for the stocks included in the Regulation SHO Pilot, which are not subject to any price test rule, and a group of Control stocks, which are subject to price test rules. Our goal is to learn additional information about the potential effect of adopting the proposal to remove price test rules during periods of market stress.[3] Specifically, we find that the absence of Rule 10a-1 and the Nasdaq Bid Test did not result in significantly lower returns on February 27th, 2007. Therefore, the results of our analysis suggest that February 27th, 2007 provides no new evidence opposing the adoption of the proposal. Specific results include:

- The price test rules did not protect stocks from negative returns.
    - Almost 99% of NYSE and Amex stocks and 97% of Nasdaq Global and Global Select stocks had negative returns on February 27th. A smaller percentage of Pilot stocks had negative returns than Control stocks.
- The absence of a price test rule did not result in larger price declines.

[1] See the Roundtable transcript (http://www.sec.gov/about/economic/shopilottrans091506.pdf), for example, the comments of Frank Hatheway (p. 27), Paul Irvine (pp.54-56), and Pete Kyle (p. 121).
[2] See comment from Bruce Thompson on February 28, 2007: http://www.sec.gov/comments/s7-21-06/bthompson8357.htm. This comment seems to be largely based on a quote by Jim Cramer.
[3] See Release No. 34-54891, File No. S7-21-06: http://www.sec.gov/rules/proposed/2006/34-54891.pdf.

  - The Pilot stocks on NYSE and Amex under-performed the Control stocks by 6 bps on February 27th. Tests reveal that this 6 bps is not statistically significant.
  - The Pilot stocks on Nasdaq under-performed the Control stocks by about half a basis point. This half a basis point is not statistically significant.

- We examined the robustness of these results, but found no cause for concern.
  - We determined that there is no longer a good control sample for the Nasdaq 100.[4]
  - When we exclude the Nasdaq 100 stocks, Pilot stocks under-perform the Control stocks by 0.6 bps, but this difference is not statistically significant.
  - Some NYSE stocks experienced a computer capacity glitch toward the end of the day. Examining only those stocks that were not affected by the glitch, we find that Pilot stocks underperformed the Control stocks by about 32 basis points. This difference is not statistically significant.
- We examined whether small stocks are affected more by price test rules, and found that the absence of a price test restriction does not adversely affect small stocks during periods of market stress.
  - We found that our smallest Pilot stocks, by market capitalization, did not under-perform the smallest Control stocks.

ANALYSIS

Samples

We collected closing prices for February 26th and 27th and shares outstanding for February 26th for all stocks from Data Stream. We merged this data with the Pilot stock lists posted by Amex, Nasdaq, and NYSE in the evening of February 26th. In addition, we merged the data with a Control sample constructed as follows. We started with the Control sample used in the OEA Pilot Report and tracked ticker symbol changes, delistings, and mergers. While allowing ticker symbols to change, we kept those stocks that were listed on Amex, Nasdaq Global or Global Select, or NYSE as of February 27th. Our Pilot sample consisted of 463 stocks listed on NYSE or Amex and 454 stocks listed on Nasdaq. Our Control sample consisted of 877 NYSE or Amex stocks subject to Rule 10a-1 and 723 Nasdaq stocks subject to the Bid Test. Because the short sale rule applied to NYSE and Amex stocks is different from the rule applied to Nasdaq stocks, we keep these stocks separate throughout our analysis.

Returns

We estimate returns as the percentage price change from the February 26th close to the February 27th close. Table 1 shows the number and percentage of Pilot and Control stocks that declined in price. Over 95% of our sample stocks declined on February 27th. The percentage of Pilot stocks declining is slightly lower than the percentage of Control stocks declining. However, the numbers appear fairly similar. For Amex and NYSE stocks, 98.7% of Pilot stocks had negative returns while 98.86% of Control stocks had

[4] In other words, if market capitalization affected returns on February 27, 2007, the Nasdaq Control group may not accurately control for all confounding effects.

SEC_OEA_FCIC_001518

negative returns. The difference was a bit larger for Nasdaq stocks as 96.70% of Pilot stocks declined to the 96.96% of Control stocks. However the difference is still very small. We can reject the hypothesis that more Pilot stocks declined than Control stocks without estimating a statistical test.

Table 1: Stocks with Price Declines

Listing Market	Sample	# of Stocks Declining	% of Stocks Declining
Amex and NYSE	Pilot	457	98.70%
	Control	867	98.86%
Nasdaq Global or Global Select	Pilot	439	96.70%
	Control	701	96.96%

Because so many stocks declined on this day, we next examine the actual returns to test whether the returns of Pilot stocks were any different than Control stocks. Table 2 shows the average returns and results of a test for the differences between the returns. The average return of NYSE and Amex Pilot stocks was -334 basis points or -3.34%. The average NYSE and Amex Control stock had a return of –328 basis points. The average Pilot stock price declined more than the average control stocks by 6 basis points.

We used a t-test to determine whether the 6 basis point difference is statistically significant. The p-value of the t-test tells us that if the true difference is zero, what is the probability of observing an average difference of -6 basis points or less? Typically, economists do not consider a result statistically significant unless the p-value is less than 0.05. Therefore, the p-value of 0.555 means that the 6 basis points is not statistically significant.

For economic significance, consider the dollar value of one basis point and the end of day transaction costs in the sample stocks. For stocks listed on NYSE and Amex, one basis point is about 0.4¢ per share and the quoted spread at the end of day on February 27th was 13 basis points for Control stocks and 12 basis points for Pilot stocks. One basis point in Nasdaq stocks is about 0.25¢ and the end of day quoted spread was 18 basis points for Control stocks and 12 basis points for Pilot stocks. There is no formal test for economic significance, but the results can be compared to these numbers when judging whether a single figure is large economically. Typically, economic significance is not an issue unless a result is first statistically significant.

For Nasdaq stocks, Pilot stocks had an average return of about -373 basis points, while Control stocks had an average return of -372 basis points. The difference is less than a basis point and is both statistically and economically insignificant.

Table 2: Stock Returns

	Amex and NYSE stocks	Nasdaq Stocks
Pilot Sample	-334 bps	-373 bps
Control Sample	-328 bps	-372 bps
Difference	- 6 bps	-0.5 bps
t-test p-value	0.5550	0.9719

Overall, these results suggest that the application of the price test rules had no effect on the stock market decline of February 27th because the stocks subject to the price test rules declined just as much as

SEC_OEA_FCIC_001519

the stocks that are not subject to the price test rules. We next check the reliability of this result by verifying whether the Control stocks are a good match for the Pilot stocks and by categorizing the stocks by institutional details that could influence the results.

Value-weighted Returns

Even though the results thus far show that Pilot stocks did not decline more than Control stocks, we still need to make sure that the Control stocks are a good match for the Pilot stocks. February 27th is over 2 ½ years after the creation of the Pilot sample. We constructed our Control sample at the same time to include stocks that could have been selected for the Pilot. The OEA Pilot report found that the Pilot and Control samples were still statistically similar immediately before the start of the Pilot, almost two years ago. It is reasonable to suspect that the Pilot and Control stocks are no longer as similar as they used to be.

We suspect that market capitalization will give us the best comparison of the samples. Table 3 shows how the average market capitalization of the Pilot stocks differs from the average market capitalization of the Control stocks. The Amex and NYSE Pilot stocks tend to be smaller than the Control stocks. The difference is not statistically significant, but it could be economically important.

The Nasdaq Pilot stocks tend to be much larger than the Nasdaq Control stocks. The difference is both statistically and economically significant. This result could stem from the inclusion of the entire Nasdaq 100 in the Pilot.[5] None of the stocks in the Control sample are as large as the stocks in the Nasdaq 100.

Table 3: Market Capitalization Differences

	Amex and NYSE stocks	Nasdaq Stocks
Pilot Sample	$8.96B	$5.72B
Control Sample	$10.26B	$1.01B
Difference	-$1.3B	***$4.71B***
t-test p-value	0.4132	***<0.0001***

To determine whether the differences in average market capitalization are economically important to our results, we re-estimate the returns for each of our samples weighting by market capitalization. For example, a stock that has a market capitalization of $1B will be weighted ten times more than a stock with a market capitalization of $100M.

Table 4: Stock Returns Weighted by Market Capitalization

	Amex and NYSE stocks	Nasdaq Stocks
Pilot Sample	-338 bps	-401 bps
Control Sample	-329 bps	-360 bps
Difference	- 8 bps	***-41 bps***
t-test p-value	0.2658	***<0.0001***

[5] See Release No. 34-54435, File No. SR-NASDAQ-2006-031: http://www.sec.gov/rules/sro/nasdaq/2006/34-54435.pdf.

SEC_OEA_FCIC_001520

Table 4 shows that the NYSE and Amex results do not change much when returns are weighted by market capitalization. The Pilot stocks now under-perform the Control stocks by a statistically insignificant 8 basis points. This figure is still not large enough to be considered economically significant.

The weighted returns tell a different story for Nasdaq stocks. The Pilot stocks now under-perform the control stocks by a statistically and economically significant 41 basis points. Interestingly, because the large stocks are weighted more heavily in the computation, this result suggests that the Nasdaq 100 may have under-performed the smaller Pilot stocks on February 27th.

Results without the Nasdaq 100

The results of the last section show that the Nasdaq Control stocks do not provide a good match for the Nasdaq Pilot stocks and that the difference affects the results. Because the differences between the Pilot and Control stocks are probably due to the inclusion of the Nasdaq 100 in the Pilot sample, we delete the Nasdaq 100 stocks from the Pilot sample and examine whether the Control stocks provide a good match.

After deleting the Nasdaq 100 stocks, we are left with 354 Nasdaq Pilot stocks and 736 Nasdaq Control stocks. Table 5 shows that the market capitalizations of the remaining Nasdaq Pilot stocks are statistically similar to the market capitalizations of the Control stocks. Therefore, the Control stocks do appear to be a good match for the Pilot stocks when the Nasdaq 100 stocks are excluded.

Table 5: Stock Returns Excluding Nasdaq 100

	Market Cap	Unweighted Returns	Weighted Returns
Pilot Sample	$1.03B	-373 bps	-346 bps
Control Sample	$1.01B	-372 bps	-360 bps
Difference	$0.02B	-0.6 bps	14 bps
t-test p-value	0.8056	0.9677	0.2566

Table 5 also re-estimates the differences in the unweighted returns and in the returns weighted by market capitalization. The unweighted return results are almost exactly the same as the unweighted return results in Table 2. The Pilot stocks have average returns that are statistically similar to the average returns of the Control stocks. The weighted returns, however, produce different results. The Pilot stocks now outperform the Control stocks by a statistically insignificant 14 basis points. These results support the conclusion that the Nasdaq Pilot stocks did not under-perform the Nasdaq Control stocks.

Results by stocks affected by the computer capacity glitch

One of the problems faced on February 27th was a queuing of orders on the NYSE toward the end of the trading day. In particular, a subset of specialist posts on the NYSE experienced severe order queuing from about 3pm until after the normal closing. Some of the affected posts closed on time before the queuing problems were resolved, while others remained open until after the queued orders executed.

We examine whether the results for NYSE stocks could be obscured by the glitch toward the end of the trading day. The queuing itself may have slowed down trading enough to mitigate differences between Pilot and Control stocks. Further, the stocks that closed before the queuing was resolved could have closed away from the true value, thus weakening our statistical tests. Therefore, we divide the

NYSE stocks into three categories based on whether they experienced a glitch and whether they closed at the regular time.

To make sure that the Control stocks are still similar to the Pilot stocks even after dividing them this way, we first estimate the average market capitalization of each of these groups. Of the 1,299 NYSE stocks in the sample, 233 did not experience the computer capacity glitch.[6] These are the stocks for which trading itself was not delayed and, therefore, where any effects of the absence of the tick test would be most pronounced. Another 344 stocks had the glitch but closed on time (we define stocks as closing on time if they closed before 4:01:30).[7] These stocks may have closed before the capacity problem was resolved and therefore, the closing prices might not reflect the true end of day balance of buying and selling interest.

The final 732 stocks experienced the computer capacity glitch but closed after the glitch was resolved. The closing price should reflect all entered buying and selling interest but the glitch itself may have obscured any effect of the absence of the tick test. Despite closing after the resolution of the glitch, the prices of these stocks may have additional problems if traders wondering if orders were lost, entered those orders more than once. If either buy or sell orders are more likely to be entered more than once, the closing price will not reflect the true buying and selling interest in the stock. Therefore, the sample that will inform us the most about the effect of the tick test is the sample of stocks that did not experience a glitch.

The Pilot stocks make up about 31 to 39% of the stocks in each of these groups: the no glitch group has 87 Pilot stocks, the glitch group that closed on time has 127 Pilot stocks, and the glitch group that closed late has 233 Pilot stocks. Table 6 shows the market capitalizations of the Pilot and Control stocks in each of the three sub-groups. For the no glitch group, the average market capitalizations of the pilot and control groups are statistically similar. The same is true for the glitch stocks with a late close. The Control stocks in the glitch group that closed on time are much larger than the Pilot stocks in the same group. Therefore, the Control stocks are not a very good match for the Pilot stocks in this category.

Table 6: Market Capitalization Controlling for Computer Capacity Glitch and Closing Time

	No Glitch	Glitch – Regular Close	Glitch – Late Close
Pilot Sample	$10.76B	$5.87B	$10.54B
Control Sample	$9.06B	$13.20B	$9.51B
Difference	$1.7B	***$7.33B***	$1.03B
t-test p-value	0.6950	***0.0345***	0.6026

To examine the effect of the tick test, Table 7 shows the daily returns for each of the subgroups and the results of a t-test for the difference between the Pilot and Control stocks. The Pilot stocks that did not experience a glitch underperformed the Control stocks by 32 basis points, but this number is not statistically significant.

For the glitch stocks, the results differ by the timing of the close. For the stocks that closed on time, the Pilot stocks outperformed the Control stocks by 38 basis points. This result is not statistically

[6] Apparently, post numbers 1 to 12 had the capacity glitch. We collected the post number for each of our sample stocks from the TAQ master file for February 27, 2007 obtained from NYSEdata.com.
[7] Closing times are from the last NYSE closing quote print the TAQ quote file for February 27, 2007 obtained from NYSEdata.com.

SEC_OEA_FCIC_001522

significant, though the p-value is just insignificant. This result should be taken with extreme caution for two reasons. First, the stocks' closing prices may not reflect all buying and selling interest. Second, because Table 6 above suggests that the Control stocks may not be a good match for the Pilot stocks, the result may be driven by differences in the characteristics of the stocks in the two groups rather than the difference in price test application.

Table 7: Stock Returns Controlling for Capacity Glitch and Closing Time

	No Glitch	Glitch – Regular Close	Glitch – Late Close
Pilot Sample	-345 bps	-301 bps	-352 bps
Control Sample	-313 bps	-339 bps	-328 bps
Difference	-32 bps	38 bps	-24 bps
t-test p-value	0.2399	0.0537	0.0627

The late closing Pilot stocks experiencing the glitch underperformed the Control stocks in the same group by 24 basis points. This result is also statistically insignificant but the p-value is close to the 0.05 significance criteria. As indicated above, this result on its surface cannot be interpreted with much confidence because the prices might reflect orders that are executed multiple times. Therefore, we cannot attribute these results solely to the Pilot.

Despite the inability to interpret what the results for the glitch stocks tell us about the Regulation SHO Pilot, we can use the results to illustrate the importance of focusing only on the sample that did not experience a glitch. The glitch clearly could have obscured the tests of the Pilot. By removing the stocks that had capacity problems toward the end of the day, we can better isolate the effect of not having a tick test on a high stress day. When isolating this effect, we can conclude that the tick test had little effect on returns.

Small Stocks

Several commenters expressed concern about removing Rule 10a-1 and the Bid Test from smaller stocks. To examine whether the absence of a price test rule affected small stocks in a harmful way, we re-ran the above tests focusing only on small stocks. First, we separated all of the sample stocks into ten groups by market capitalization. The groupings were made without regard to Pilot status or listing market. We then removed the Nasdaq 100 stocks, separated the stocks into groups by listing market, and re-ran our tests.

Table 8 shows the results for the smallest group of stocks only. The smallest group consists of 19 Pilot stocks listed on the NYSE and Amex, 36 Control stocks listed on the NYSE and Amex, 56 Pilot stocks listed on Nasdaq, and 140 Control stocks listed on Nasdaq. For both markets, the Pilot sample experienced higher returns than the Control sample, but the difference was not statistically significant.

Table 8: Stock Returns for the Smallest Stocks

	Amex and NYSE Stocks	Nasdaq Stocks
Pilot Sample	-279 bps	-309 bps
Control Sample	-361 bps	-334 bps
Difference	82 bps	24 bps
t-test p-value	0.3488	0.6200

SEC_OEA_FCIC_001523

February 27th Pilot Analysis

We also re-estimated the test for each of the other size groups. Only one NYSE and Amex size group and only one Nasdaq size group showed results that support the hypothesis that Pilot stocks under-performed Control stocks. Both of these groups were mid-sized groups. Therefore, the evidence does not suggest that the absence of price test rules harms small stocks during periods of market stress.

Summary and Conclusions

We examine the effect of having a tick test during an unusual market decline by comparing the daily price performance of stocks in the Regulation SHO Pilot to similar stocks that are not in the Pilot ("Control stocks") on February 27th, 2007. Overall, we find that the returns of the Pilot stocks appear slightly lower than the returns of the Control stocks, but the difference is not statistically significant. We verified this result by re-examining the data in several ways. We do not find any other results that are compelling enough to support a different conclusion. Further, the results are similar for small stocks, except that small Pilot stocks are insignificantly higher than small Control stocks. We believe that the conclusions of this analysis provide no new evidence opposing the adoption of the proposal.

We should note that while this market decline of 3.3% on February 27th, 2007 is large by today's standards, it is not large compared to returns experienced in the past. An examination the daily returns in the Dow Industrial Average from January 3, 1900 to February 24, 2006 reveals that the daily return was below -3% on 1.09% of the trading days. This means that on average, each year the Dow experiences almost three trading days of market declines of at least the magnitude experienced on February 27th, 2007.

Further, the relative calm of the pilot period has thus far provided only one large market decline to study. We caution about extrapolating too much based on the results of this one day. The effect of the price test might not be the same on every 3% market decline and might differ when the market declines much more than 3%.

OFFICE OF ECONOMIC ANALYSIS
DRAFT MEMORANDUM

To:	Distribution List
From:	Office of Economic Analysis
Date:	Revised: February 2, 2009
Re:	Abnormal Market Volatility and the 2008 Market Crisis

This memo provides statistical information and analysis relating to stock market volatility during the market crisis, especially since September 2008. In order to better understand whether the volatility during the 2008 financial crisis differs from that experienced during other turbulent periods, such as October 1929, the Great Depression, and October 1987, we provide information about market volatility over more than a century. We evaluate volatility both on a daily basis as well as intraday. We also provide information on how market volatility in the United States has compared with market volatility in other parts of the world during this period. Some of the key points are:

- Realized volatility from mid-September through November 2008 was extraordinarily high, reaching levels comparable to October 1929 and October 1987. [Figures 1, 2]

- History suggests that if the financial crisis continues unresolved, equity markets are likely to continue experiencing high volatility. During the Great Depression, markets experienced prolonged periods of very high volatility, especially between 1931 and 1933 and between 1937 and 1940. [Figure 2]

- Volatility declined substantially between November 2008 and December 2008, but remained above its long-run average. The CBOE VIX index, which is a forward-looking measure designed to gauge the market's forecast of future volatility, declined from a peak above 80 on November 20 to close at 40 on December 31, 2008, and remained in the 40s most of the time in January 2009. [Figure 3]

- After normalizing volatility to correct for changes in the overall level of volatility and the typical pattern in intraday volatility, volatility in the last half hour of the day was abnormally high during the 4th quarter of 2008, compared to historical norms. A similar phenomenon of abnormally high volatility near the end of the day was observed in other periods of market instability, such as in 1987 and 1997. [Figures 4-8].

- The large increase in volatility observed in the United States was also observed in the world's other equity markets. Peak volatility in Europe during October and November was comparable to that in the U.S., while volatility in Japan and Hong Kong was higher. [Figures 9-10].

- Other results include:

- The proportion of total volatility occurring overnight while the market was closed was slightly higher than usual. [See Appendix 2]

- In the third and fourth quarter of 2008, there were 16 days with an absolute return greater than two percent on the S&P 500 index during the final half hour of trading, most of which occurred in October and November. [Appendix 3]

- The day with the most extreme end-of-day volatility was October 29, 2008, when the S&P 500 index fell nearly five percent in the final eleven minutes of trading. This end-of-day decline was observed across all sectors of the S&P 500, but was largest in the Financial Sector. [Appendix 3]

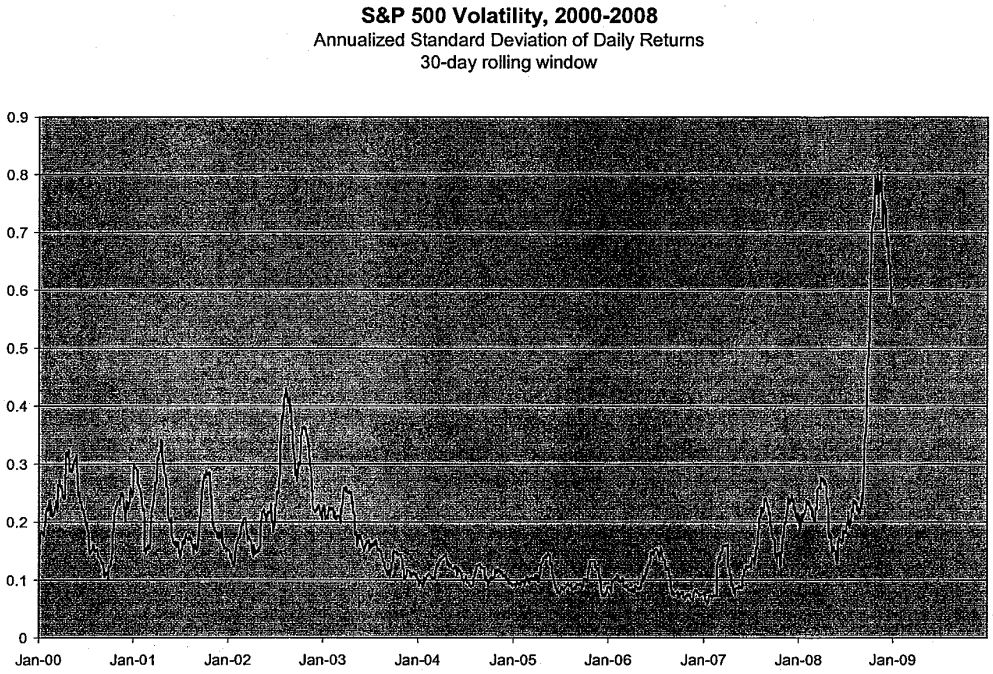
Historical Context

To aid in evaluating the magnitude of stock market volatility during the 2008 financial crisis, it is useful to consider the current level of volatility in context of the historical record. Figure 1 shows a graph of realized volatility on the S&P 500 index from January 2000 through December 2008.[1] As the graph indicates, market volatility began to rise near the end of February 2007, and increased substantially in August 2007. Volatility remained at levels comparable to the early 2000s until the middle of September 2008, at which point volatility increased precipitously.

Figure 1



Taking a step back to look at the longer historical record, Figure 2 shows a graph of market volatility for the period 1900-1950 (upper panel) and 1951-2008 (lower panel). This provides a comparison of the current volatility with that experienced during prior crises.[2] As the graphs indicate, the volatility spike that occurred in the 4th quarter of 2008 is roughly comparable in magnitude to those of other crisis periods: October 1929 and October 1987. Note that the market experienced prolonged periods of very high volatility during the Great Depression, particularly from 1931 to 1933, and from late 1937 to mid-1940 but not after the market decline in October 1987.

---

[1] In this graph, volatility was measured as the annualized standard deviation of log of daily returns over a rolling window of 30 trading days.

[2] The bottom panel is based on the returns of the S&P 500 Index. Because the S&P 500 index does not go back far enough, the top panel uses alternative market indices compiled by the Center for Research in Securities Prices (CRSP) beginning in 1926, and by Professor William Schwert at the University of Rochester for the period prior to 1926.

Market Volatility Forecast

The graphs in the previous section are based on historical measures of realized volatility. These metrics are inherently "backward-looking," in that they only measure what happened in the past, they do not reflect what the market perceives likely to happen in the future. The CBOE Volatility Index (VIX) is a "forward-looking" measure, designed to capture the market's forecast of volatility for the month, as reflected implicitly in the prices of exchange-traded S&P 500 index options. Figure 3 graphs the level of the VIX index from before the crisis until January 30, 2009. The index peaked above 80 on November 20, 2008, and declined to close at 40 at the end of the year. During January 2009, the index remained predominantly in the 40s, but fluctuated between an intraday low of 36.88 on January 2 to an intraday high of 57.36 on January 20.

SEC_OEA_FCIC_001529

General Pattern in Intraday Volatility

It has long been known that stock market volatility follows a U-shaped pattern over the trading day, with volatility higher near the beginning and end of trading hours than in the middle of the day.[3] This pattern has been observed over a long period of time in various markets, and is not unique to periods of market crisis. Some commentators have suggested that end-of-day volatility during the 2008 crisis has been abnormally high, and have expressed concerns that this may be related to trading by certain groups or linked to certain instruments such as leveraged Exchange-Traded Funds. In order to assess the extent to which end-of-day volatility was abnormally high during the 2008 crisis, we compared the intraday volatility pattern during the crisis to the typical pattern observed in other periods.

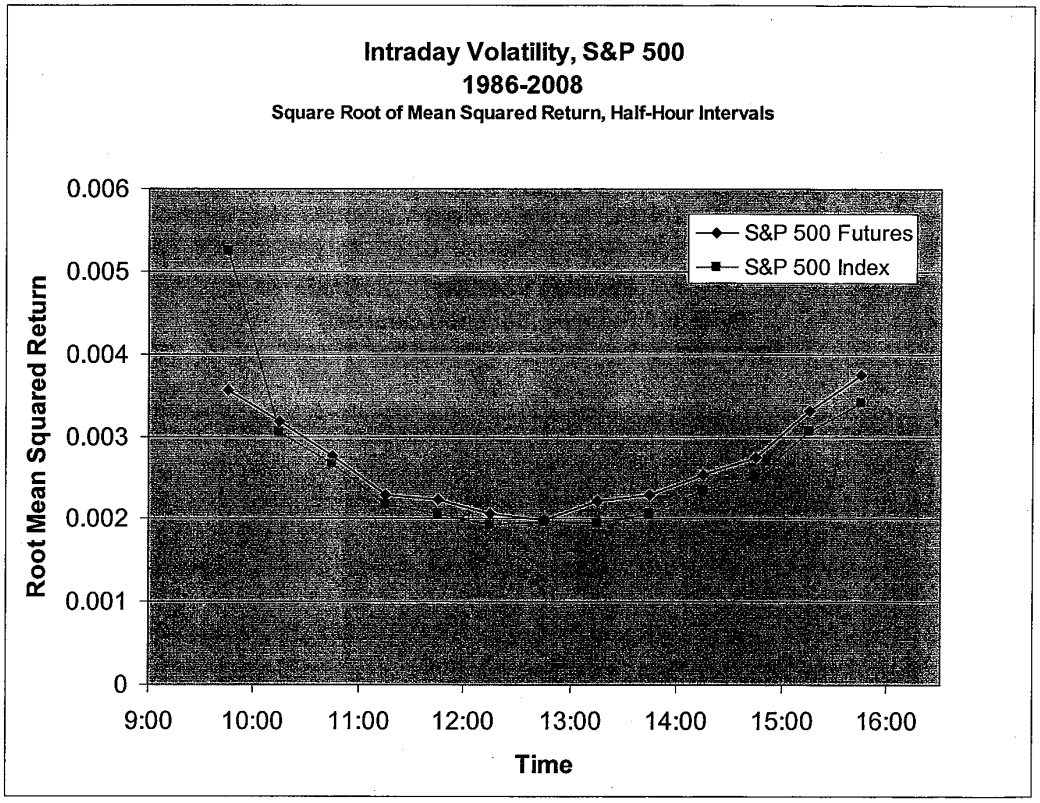
To establish the typical pattern of market volatility over the day, we used data provided by TickData to examine price movements of the S&P 500 index and S&P 500 Futures over 30-minute intervals. We verified that over the course of the day volatility tends to follow a U-shaped pattern: volatility begins high, decreases over the first two hours of the trading day, remains low between 11:30 and 2:00, and increases over the last two hours. The same basic pattern was observed for both S&P 500 Futures prices and S&P 500 Index values.

Figure 4 graphs the volatility on the cash index and on the futures price for each half-hour period over the period 1986-2008. As the figure indicates, volatility at both the beginning and end of the day is approximately 10 basis points higher than during the middle of the day.

Note that for the first half-hour period of the day, the index return was significantly more volatile than the futures return. This is due to the fact that the index value at 9:30 is computed before the opening prices of the component stocks has been established, and so it is computed with stale prices that do not reflect the overnight return. This is not an issue for the futures price so the subsequent analysis only used S&P 500 Futures prices.

[3] For example, see Lockwood, Larry J. and Scott C. Linn, 1990, "An Examination of stock market return volatility during overnight and intraday periods, 1964-1989." Journal of Finance v45 pp. 591-601.

Figure 4

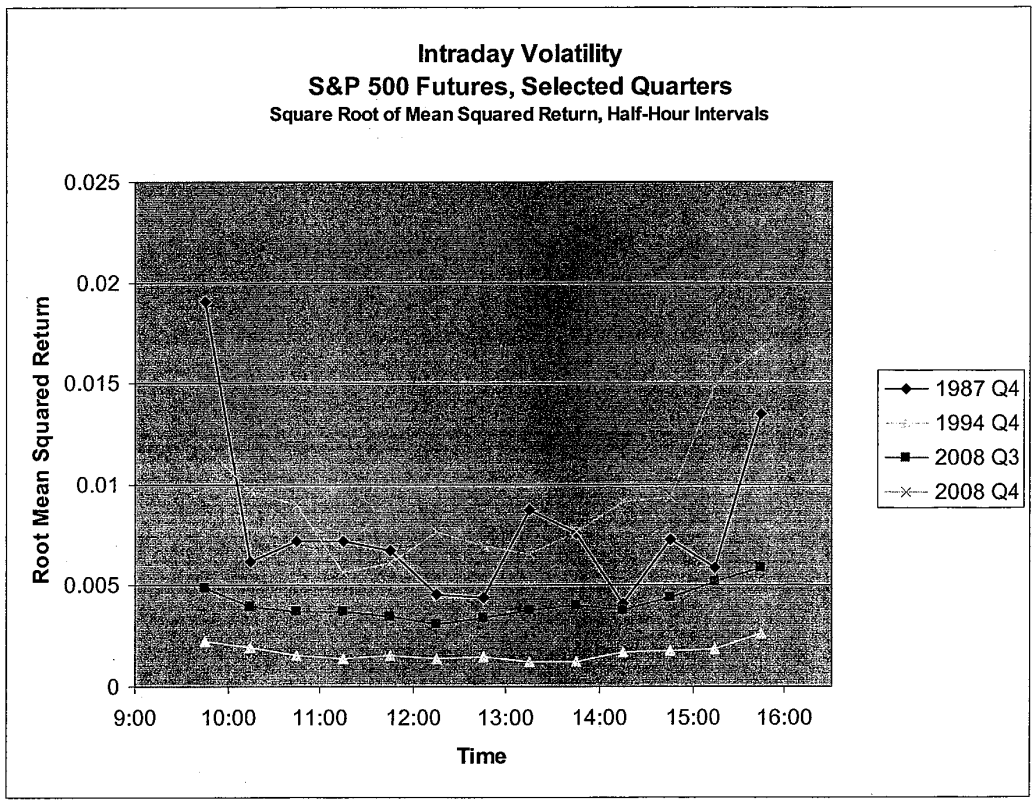


DRAFT: Produced by OEA

SEC_OEA_FCIC_001531

For purposes of comparison, Figure 5 presents intraday realized volatility on S&P 500 futures for a typical period of low volatility (Fourth Quarter of 1994), a historical market crisis (Fourth Quarter of 1987), and the current financial crisis (Third and Fourth quarters of 2008). As the graph indicates, the U-shaped pattern was observed in all cases, but was more pronounced in times of crisis, especially Q4 of 1987 and Q4 of 2008.

Figure 5



DRAFT: Produced by OEA

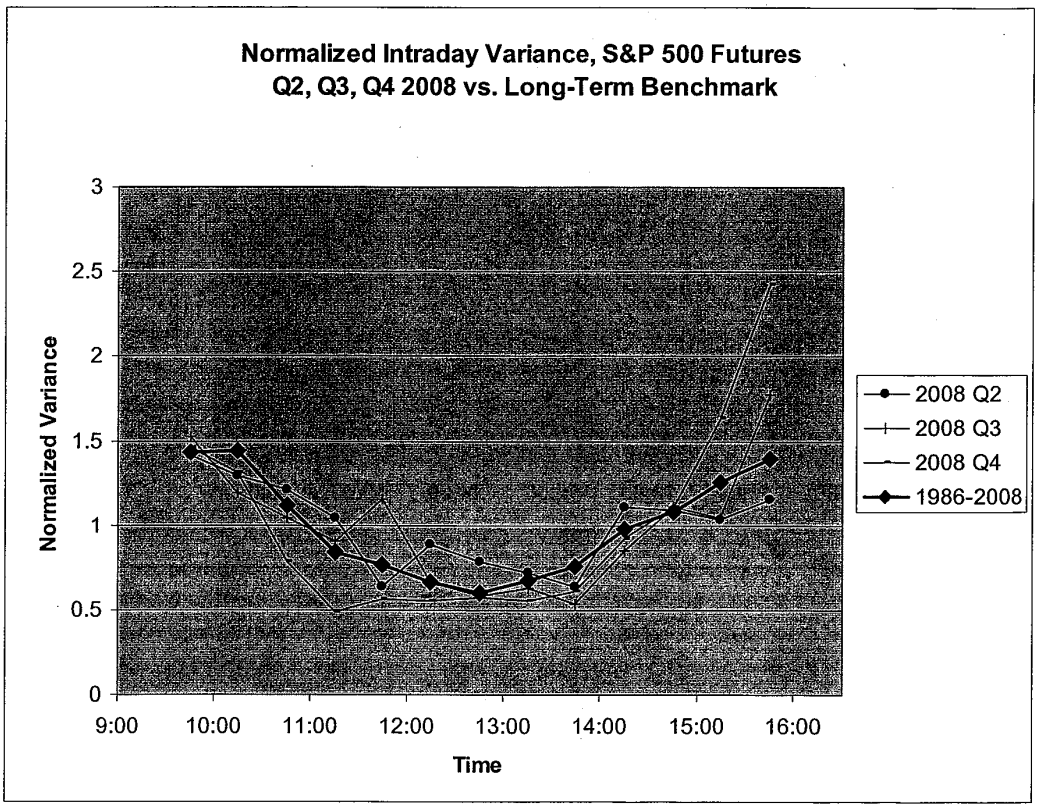
SEC_OEA_FCIC_001532

Abnormal End-of-Day Volatility

In order to establish a more meaningful comparison of intraday patterns across high-and low-volatility periods, we developed a metric called "normalized variance" that isolates the contribution of each half-hour period to total volatility, while controlling for total volatility. See Appendix 1 for how this metric is calculated. To interpret values of this variance metric on the following graphs, a value of 1.5 observed for the last half hour of the day indicates that return variance is 50% higher than the intraday average on the same day. If volatility is U-shaped over the day, this variance metric will be higher than one near the beginning and end of the day, and lower than one in the middle of the day.

Figure 6 graphs the intraday pattern in this variance metric for Q2, Q3, and Q4 of 2008, alongside the long-term benchmark pattern estimated over the period 1986-2008. The graph shows that end-of-day volatility was no higher than usual in Q2 of 2008, but became higher during the crisis. In particular, variance was particularly high the fourth quarter of 2008, when volatility in the last half hour of the day was nearly 2 ½ times the intraday average.[4]

Figure 6



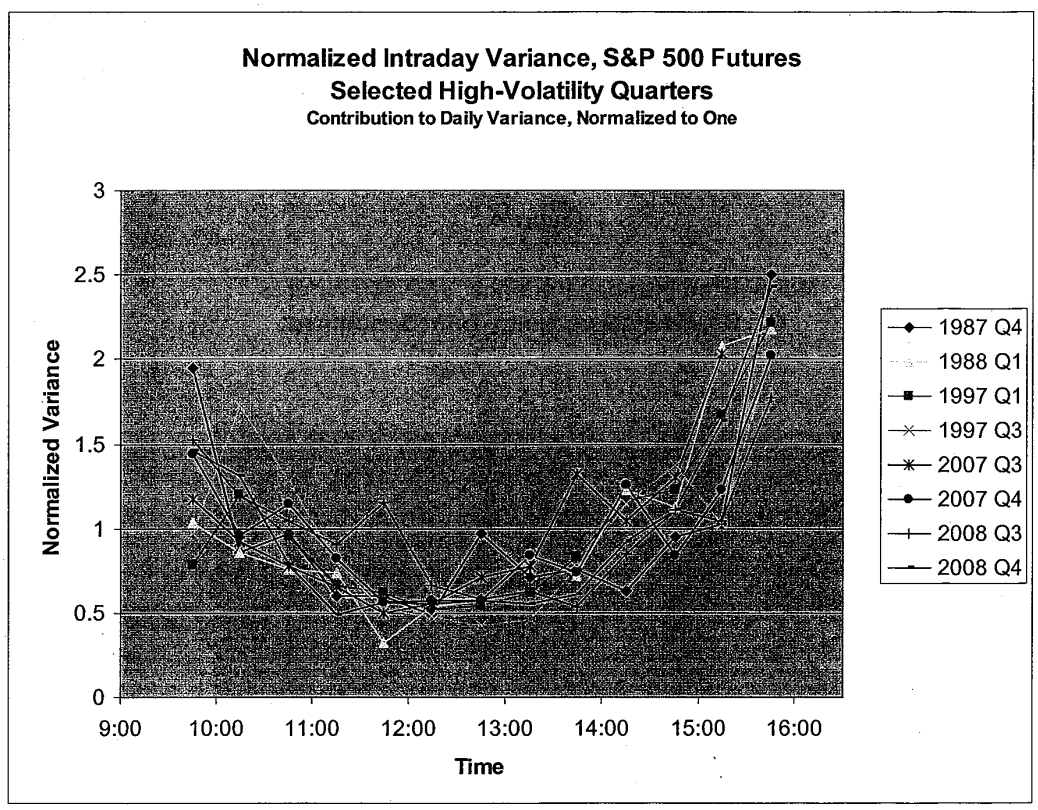
[4] Although it is not shown on the graph, it is worth noting that end-of-day variance was also high during the third and fourth quarters of 2007, when variance in the last half hour of the day was roughly double the intraday average.

DRAFT: Produced by OEA

SEC_OEA_FCIC_001533

Figure 7 presents the intraday volatility pattern for the third and fourth quarters of 2007 and 2008 side by side with similar graphs from other times of market turbulence, including two quarters around the 1987 market crisis and two quarters in 1997. The figure demonstrates that abnormally high end-of-day volatility was not unique to the 2008 crisis. For example, in the fourth quarter of 1987, variance in the last half hour of the day was 2.50 times higher than the intraday average, even higher than the ratio of 2.42 observed in the fourth quarter of 2008.

Figure 7

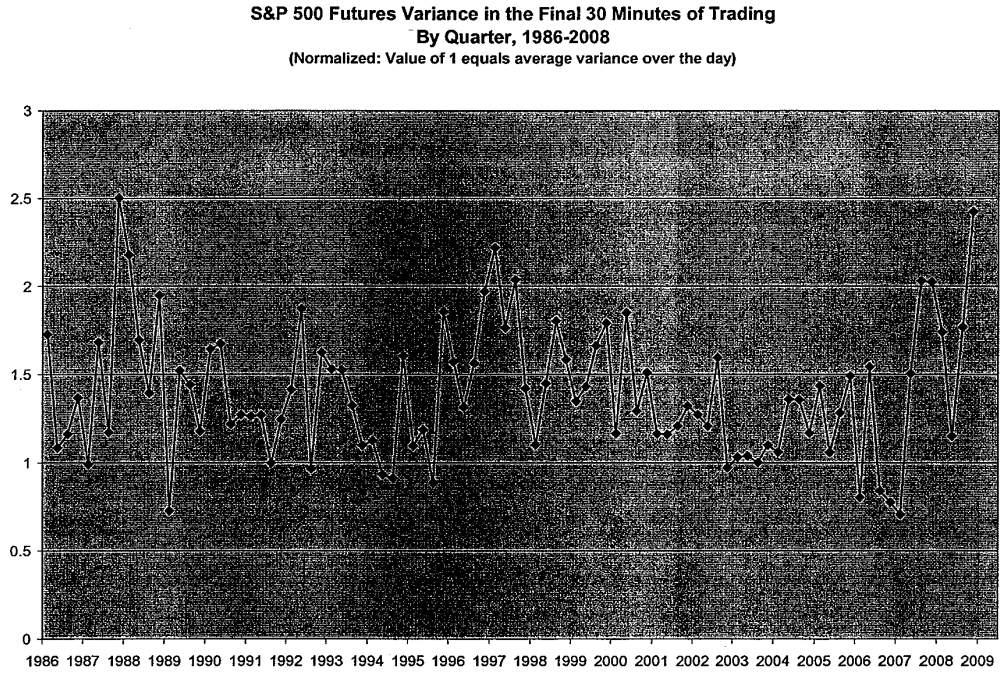


DRAFT: Produced by OEA

SEC_OEA_FCIC_001534

To further investigate historical patterns of end of day volatility, Figure 8 graphs variance in the last half hour of the day for each quarter since 1986. As the graph indicates, variance was greater than one for the vast majority of quarters, indicating that volatility has consistently been higher at the end of the day than during the middle of the day. It has not been uncommon for normalized variance (averaged over the quarter) to exceed 1.5, especially in the late 1980s and the late 1990s. Average normalized variance greater than 2.0 has been unusual, observed for only seven quarters since 1986. The peak values of volatility occurred in periods of market turbulence: Q4 of 1987 and Q4 of 2008, respectively.

Figure 8



DRAFT: Produced by OEA

SEC_OEA_FCIC_001535

Volatility in International Equity Markets

The 2008 financial crisis affected markets all over the world. This section provides graphs that compare volatility in the U.S. with volatility in various international equity markets, based on index data obtained from Datastream International.

Figure 9 shows volatility for North American Markets including the NYSE Composite index, the Nasdaq Composite Index, and the Toronto TSX Composite. While the prior graphs based on the S&P 500 index included both NYSE and Nasdaq components, Figure 9 separates the two markets, and shows that volatility during the 2008 crisis was slightly higher for NYSE stocks than for Nasdaq stocks. Volatility in Canadian stocks was comparable to Nasdaq stocks.

Figure 9

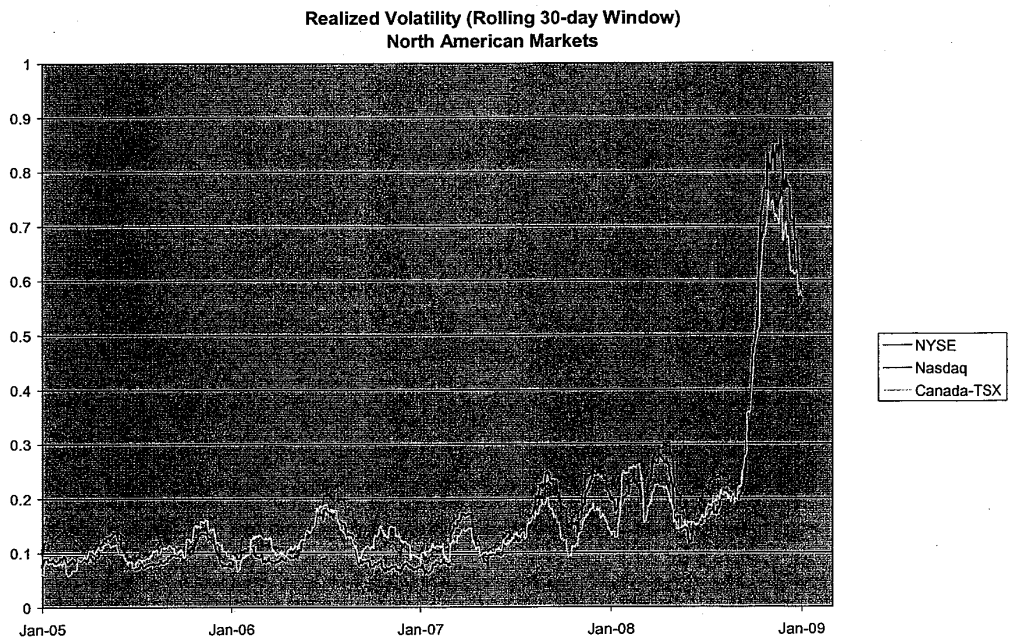


Figure 10 shows volatility for various European and Asia-Pacific Markets. The European markets exhibited a similar pattern, with volatility peaking somewhere between 70% and 80% in November 2008 (slightly lower for the Swiss index). Realized volatility in the Japanese and Hong Kong markets was particularly high, with 30-day rolling volatility for both the Nikkei 225 and Hang Seng indexes peaking around 100% in mid-November. Volatility in the Shanghai Stock Exchange index was substantially higher than the other main international stock indices over the prior two years, but was lower during the fourth quarter of 2008. Volatility in the Australian market also increased in the fourth quarter of 2008, but not as much as in the world's other major equity markets. The pattern of volatility in the Korean equity market was similar to that in the U.S.

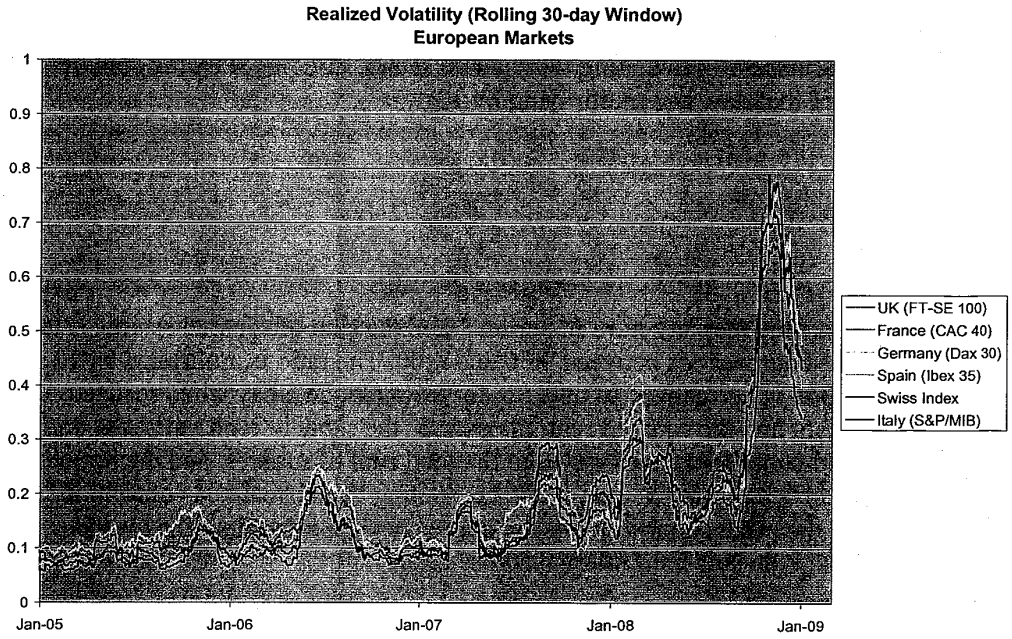
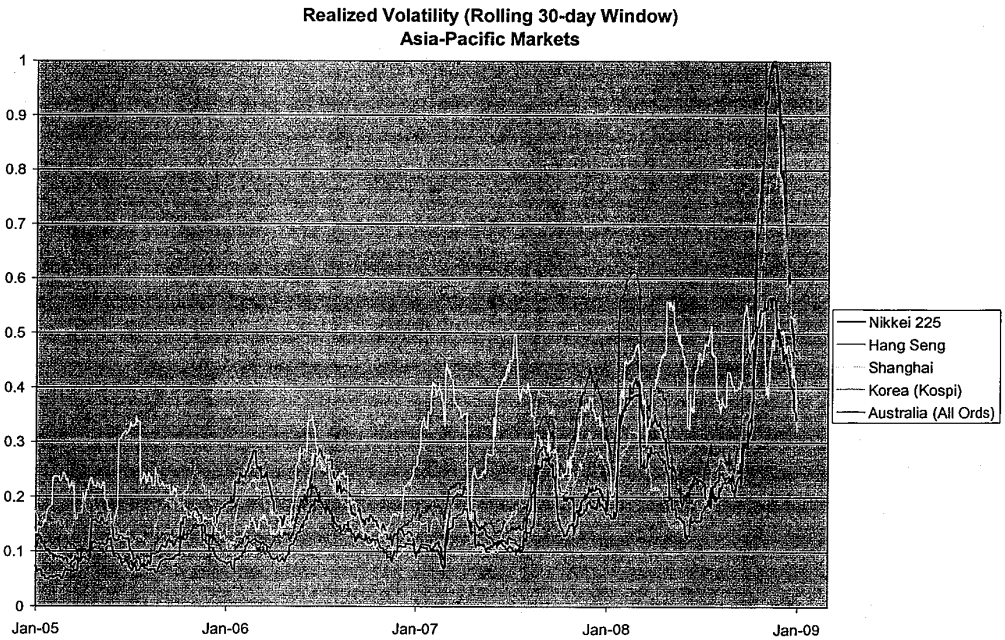
Figure 10





DRAFT: Produced by OEA

SEC_OEA_FCIC_001537

Appendix 1: Calculation of Volatility Metric

This Appendix presents the calculation of the volatility metric that isolates the contribution of each half-hour period to total volatility, while controlling for total volatility. In particular, for each half-hour period each day, we computed the normalized contribution to variance by calculating the squared return, dividing it by the sum of squared returns for that day, and multiplying by 13:

$$C_i = 13 \times \frac{R_i^2}{\sum_{j-1}^{13} R_j^2}$$

where R_i represents the market return in period *i,* and the sum of squared returns is taken across the 13 half-hour periods between 9:30 and 4:00. The ratio is multiplied by 13 so that the contribution is normalized to one. So, for example, on a day when realized volatility is constant and the squared return is exactly the same in each half-hour period, each period would contribute exactly 1/13 to the total sum of squares, and the normalized contribution would be constant at one. After computing the normalized contribution each half hour of each day, these contributions are aggregated by computing the mean contribution for a given half-hour interval across days.

DRAFT: Produced by OEA

SEC_OEA_FCIC_001538

Appendix 2: Open-To-Close vs. Overnight Volatility

This Appendix addresses the question of how high is volatility during trading hours compared to the volatility when the market is closed, as reflected in the overnight return. To address this question, we observed the S&P 500 futures price immediately after 9:30 AM and immediately prior to 4:00 each day. For each day t, we computed the overnight return from 4:00 on day t-1 to 9:30 on day t (R_{to}) and the open-to-close return on day t (R_{td}). We then computed the ratio of the squared open-to-close return to the sum of the two squared returns. This represents the relative contribution of the open-to-close return to total variance, denoted OCV:

$$OCV = \frac{R_{td}^2}{R_{to}^2 + R_{td}^2}.$$

In the extreme case where all price changes occur between 9:30 and 4:00 and the overnight return is always zero, the OC metric would equal one. In the opposite case where the price always remains constant between 9:30 and 4:00 and all price changes occur overnight, the OC metric would equal zero. The metric was computed each day then aggregated across days for each quarter from 1986 to 2008.

As indicated in Figure 11, the Open-to-Close Return typically represented around 60-70% of total variance, with a slight downward trend over time.

Focusing on those quarters having abnormally high end-of-day volatility, some of these quarters also had a low value for OCVs. In other words, during time periods that experienced market turbulence, relatively more volatility occurred overnight. For example, Figure 11 shows that Q4 of 1987, Q4 of 1997, and Q3 and Q4 of 2007 had relatively low values of OCV. However, the OCV metric was not particularly low for Q3 or Q4 of 2008.

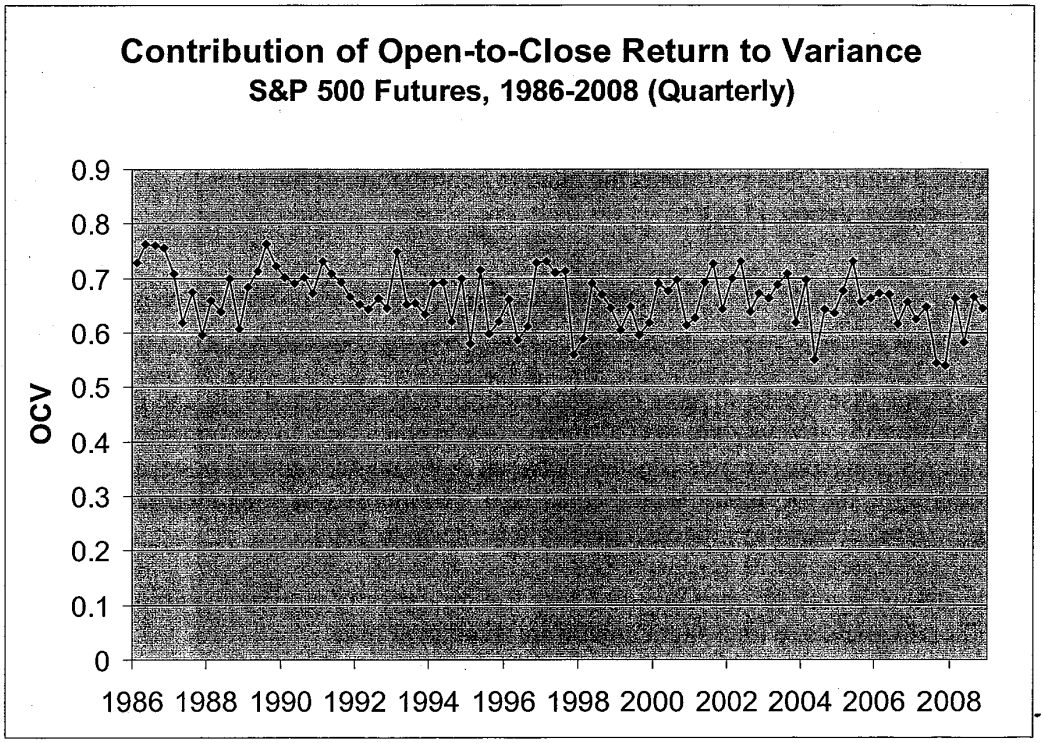
Figure 11



DRAFT: Produced by OEA

SEC_OEA_FCIC_001540

Appendix 3: Extreme Days

The analysis in this memo established that proportion of total volatility attributable to the last half hour of the day was high during the third and fourth quarters of 2008. To further investigate this phenomenon, we isolated days within this six month period that had extreme volatility. We found that during that period of time, fourteen of the sixteen largest end-of-day return events occurred in October and November, including four that occurred between October 23 and October 29, and seven that occurred between November 13 and November 21. Note that returns at the end of the day on high volatility days were both positive and negative. The following table reports the sixteen days between July 2008 and December 2008 for which the absolute value of the return on the S&P 500 index, during the last half hour of the trading day, was greater than two percent. The table also reports the return and normalized variance for S&P 500 Futures in the last half hour of the day.

Table 1

Date	Index Return 3:30-4:00	Futures Return 3:30-4:00	Normalized Variance
October 29, 2008	-4.13%	-4.26%	9.32
November 21, 2008	3.40%	3.16%	4.62
November 14, 2008	-3.38%	-3.49%	6.83
October 28, 2008	3.33%	3.30%	4.79
October 13, 2008	3.16%	3.11%	7.94
October 8, 2008	-3.16%	-3.28%	3.34
October 15, 2008	-3.11%	-2.84%	7.30
October 27, 2008	-3.00%	-2.76%	5.79
November 13, 2008	2.63%	2.64%	2.62
October 23, 2008	2.62%	2.94%	3.85
November 20, 2008	-2.56%	-2.72%	3.76
November 18, 2008	2.27%	2.08%	3.99
September 17, 2008	-2.18%	-2.17%	5.74
December 1, 2008	-2.12%	-2.10%	5.33
November 19, 2008	-2.08%	-1.76%	4.00
November 17, 2008	-2.04%	-2.08%	5.14

October 29, 2008

Of all the days in the last two quarters of 2008, October 29 stands out in terms of abnormal activity at the end of the trading day. As reported in Table 1, this was the only day on which the absolute returns on the S&P 500 index and on the S&P 500 index futures between 3:30 and 4:00 exceeded four percent. In addition, the normalized variance measure—equal to 2.42 on average during the fourth quarter of 2008—was equal to 9.32 on this date. In other words, end-of-day volatility on October 29 was high, not only compared to the average end-of-day, but also compared to volatility earlier that day.

Figure 12 shows the intraday graph for the S&P 500 on October 29, 2008. Of particular interest on this day, the S&P 500 index increased by 3.25% in less than 15 minutes between 3:11:18 and 3:26:03, then at the end of the day decreased by 4.92% in 11 minutes between 3:48:48 and 3:59:48. Some commentators attributed this end-of-day move to a Dow Jones news story reporting comments by Jeff Immelt, CEO of General Electric (GE). Another news story reports that "traders said hedge funds and mutual funds were dumping stocks to raise cash to repay clients and lenders, while other investors were eager to lock in some profit from Tuesday's huge rally."[5]

Figure 12

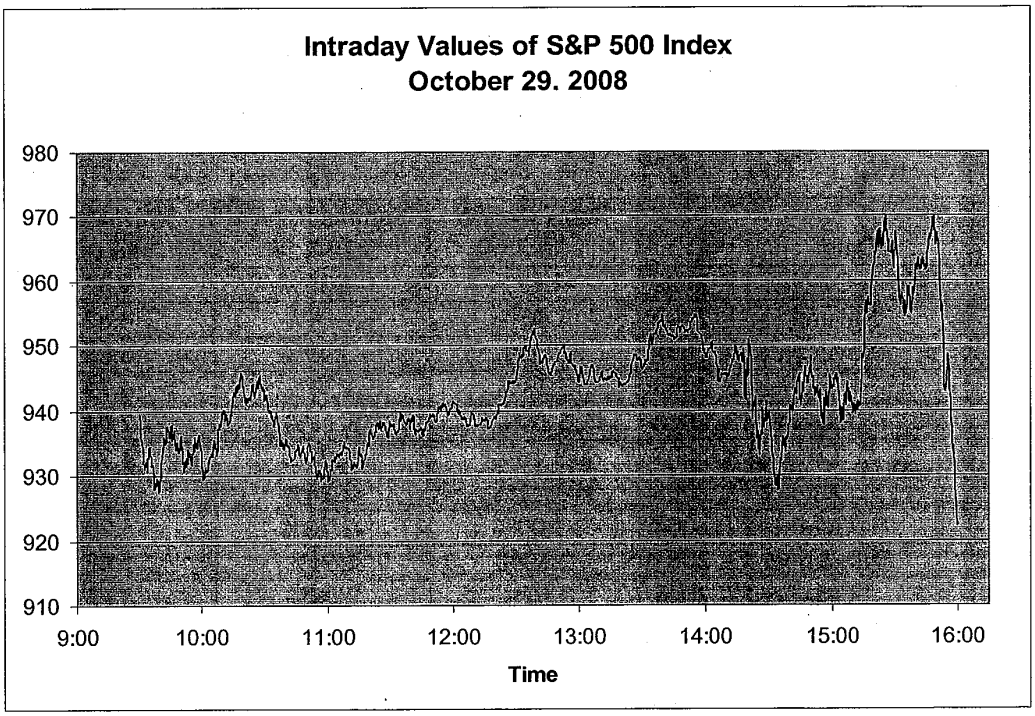


Figure 13 narrows in on the end of the day, and graphs the returns for Energy, Financial, Health Care, Information Technology, Retail, and "Other" components of the S&P 500. As the graph indicates, the return pattern on the S&P 500 index was observed in each of these sectors, but the financial stocks experienced the greatest decline during this period.

Table 2 reports the S&P 500 component stocks having the largest negative returns during the last 15 minutes of the day on October 29. As the table indicates, many of the worst performing stocks over this period were insurance companies and other large financial services firms. Contrary to the assertion that GE stock was driving this decline, GE was not among the 50 S&P 500 stocks with the most negative returns over this period.

[5] "Offhand Comment Sinks GE Stock, Maybe Market," The Ticker, washingtonpost.com, October 29, 2008. "Dow, S&P 500 fall on profit worry, GE's outlook," Kristina Cooke, Reuters, October 29, 2008.

Figure 13

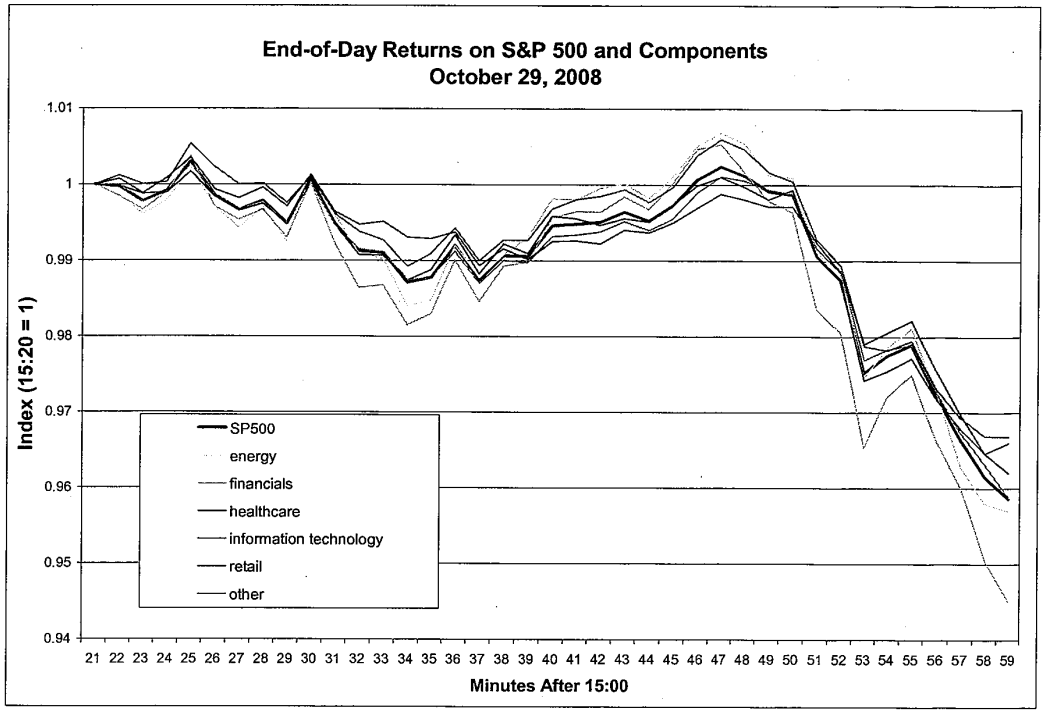

Table 2:
S&P 500 Stocks with the Most Negative End-of-Day Returns on 10/29/2008

Stock	Return 3:45-4:00
MetLife	-9.59%
Prudential Financial	-8.79%
Bank of New York Mellon	-8.65%
Office Depot	-8.30%
Hartford Financial Services Grp	-8.07%
Morgan Stanley	-7.71%

SEC_OEA_FCIC_001543

November 21, 2008

The top graph in Figure 14 shows the intraday movements of the S&P 500 index on November 21, 2008. On this day, the index rose precipitously in the final hour of the day, rising 7.29% between 2:59:09 and 3:59:54. Some commentators linked this market move to reports that President-Elect Obama would nominate Timothy Geithner as Treasury Secretary.[6]

November 14, 2008

The bottom graph in Figure 14 shows the intraday movements of the S&P 500 index on November 14, 2008. This was a particularly volatile day, with the index declining roughly 4.1% between 9:57 and 12:18, increasing more than 5.4% between 12:18 and 3:00, and then decreasing nearly 4.9% in the last hour of trading.

Economic Analysis of the Short Sale Price Restrictions under the Regulation SHO Pilot

A Study by the Staff of the Office of Economic Analysis[1]

I Introduction

A. Background

Short selling in exchange-listed stocks ("Listed Stocks") in the U.S. has been subject to a "tick test" since 1938. Rule 10a-1 under the Securities Exchange Act of 1934 allows short sales to occur only at an uptick or a zero uptick (also known as a "zero-plus tick") for Listed Stocks. That is, short sales in Listed Stocks may be effected above the last trade price or at the last trade price if the last trade price is higher than the most recent trade at a different price.[2] Prior to August 1, 2006, Nasdaq was not operating as an exchange and, therefore, its stocks were not Listed for the purposes of Rule 10a-1. However, in 1994, the National Association of Securities Dealers ("NASD") introduced a "bid test" for Nasdaq National Market Stocks ("Nasdaq NM Stocks"), which applies to trading on Nasdaq and trading reported to the NASD. This rule, the former NASD Rule 3350, specifies that whenever the bid is a downtick from the previous bid, traders other than market makers may sell short only at prices one penny above the bid.[3] Within this report, the tick test and bid test will be described more generally as "price restrictions."

---

[1] For further information please contact Amy Edwards (edwardsa@sec.gov), Stewart Mayhew (mayhews@sec.gov), Tim McCormick (mccormickt@sec.gov), or Allan Zebedee.

[2] Paragraph (a) of Rule 10a-1 governs short sales of any security registered on, or admitted to unlisted trading privileges on, a national securities exchange if such transactions are made pursuant to an effective transaction reporting plan as defined in Rule 600 of Regulation NMS. Unless a specific exemption applies, short sales are prohibited at a price that is either (1) below the last reported price of a transaction reported pursuant to an effective transaction reporting plan (known as a "minus tick"); or (2) at the last reported price if that price is lower than the last reported different price (known as a "zero-minus tick").

[3] When Nasdaq began operating as a national securities exchange, NASD Rule 3350 was replaced by Nasdaq Rule 3350 for Nasdaq NM stocks traded on Nasdaq, and NASD Rule 5100 for Nasdaq NM stocks traded over-the-counter and reported to a NASD facility. In connection with Nasdaq commencing operations as a national securities exchange the Nasdaq National Market was renamed to the Nasdaq Global Market and Nasdaq NM stocks were renamed Nasdaq Global Market stocks. See NASD Rule 4200(a)(6) (providing that the Nasdaq Global Market is the successor to the Nasdaq National Market); see also Securities Exchange Act Release No. 54071 (June 29, 2006),

In July 2004, the Securities and Exchange Commission (the "Commission" or the "SEC"), adopted Regulation SHO, which contains Rule 202T, allowing the Commission to establish, by separate order, a pilot program to examine the efficacy of price restrictions.[4] At the same time, the Commission issued an order ("Pilot Order") establishing a pilot program ("Pilot") exempting a third of the stocks in the Russell 3000 Index ("Russell 3000") from all price restrictions.[5] The pilot stocks constitute a sample of Russell 3000 stocks that is stratified across average daily trading volume levels within each of three groups, corresponding to New York Stock Exchange ("NYSE,") Nasdaq, and American Stock Exchange ("AMEX") issues.[6] The Pilot went into effect on May 2, 2005, and was scheduled to end on April 28, 2006,[7] but has been extended to August 6, 2007 to allow the Commission to consider potential rulemaking after evaluating the results of the Pilot.[8]

The Pilot was designed to enable the Commission and the broader community to evaluate whether the price restrictions have a substantive impact on market quality, and more generally to achieve a deeper understanding of how price restrictions affect the trading process. In its Pilot Order, the Commission provided further explanation for the Pilot:[9]

> The Pilot will enable us to obtain empirical data to help assess whether short sale regulation should be removed, in part or in whole, for actively-traded securities, or if retained, should be applied to additional securities. The Pilot will allow us to study trading behavior in the absence of a short sale price test on the stocks selected by comparing the trading behavior of the control group stocks to that of

---

71 FR 38922 (July 10, 2006) (File No. SR-NASD-2006-068). For purposes of this study, we refer to Nasdaq NM stocks as Nasdaq NM or Nasdaq Stocks and not Nasdaq Global Market stocks. Prior to Nasdaq commencing operations as an exchange, Nasdaq securities traded on exchanges on an unlisted trading privileges basis were not subject to any price restriction.

[4] See the adopting release, SEC Release No. 34-50103, July 28, 2004.

[5] See the first Pilot Order, SEC Release No. 34-50104, July 28, 2004.

[6] Stocks were selected for this sample by sorting the 2004 Russell 3000 first by listing market and then by average daily dollar volume from June 2003 through May 2004, and then within each listing market, selecting every third company starting with the second.

[7] SEC Release No. 34-50747, November 29, 2004.

> the Pilot stocks through empirical analysis. We will examine, among other things, the impact of price tests on market quality (including volatility and liquidity), whether any price changes are caused by short selling, costs imposed by a price test, and the use of alternative means to establish short positions.

To the extent that price restrictions have discernable effects, these should appear as differences between the pilot stocks, which the Commission selected to be a representative subsample of the Russell 3000 index, and the rest of the Russell 3000, which serve as control stocks. The results observed from the Pilot will help inform any subsequent rulemaking that the Commission may consider at the conclusion of the Pilot.

B. Overview

The goal of this study is to examine whether eliminating price restrictions has had any impact on market quality, broadly defined. We compute and compare various market statistics for pilot and control stocks both before and during the Pilot. The pilot stocks and control stocks are statistically similar prior to the Pilot. The analysis is conducted separately for both Listed Stocks and for Nasdaq NM Stocks to help distinguish the tick test from the bid test.

We designed this study to evaluate the various policy alternatives outlined in the first Pilot Order.[10] For example, the results of the Pilot might suggest eliminating all price restrictions, extending a uniform test to all securities, or removing price restrictions for a subset of stocks. Any of these alternatives would potentially affect not only the stocks in the Russell 3000, but others that have a lower market capitalization and perhaps are less actively traded than those in the pilot study. Price restrictions may have different effects for larger and smaller market capitalization stocks, or for more actively traded and less actively traded stocks. Accordingly, as part of our comparison of pilot and control stocks, we partition the sample into

[10] See SEC Release No. 34-50104, July 28, 2004.

SEC_OEA_FCIC_001550

groups based on market capitalization and turnover (trading volume divided by shares outstanding). The results for the smallest and least actively traded stocks within the Russell 3000 would be the most informative about the likely impact of price restrictions for those stocks that are not in the Russell 3000. Moreover, comparing large and small stocks (or high and low volume stocks) within the Russell 3000 should reveal whether any effects of the price restrictions are related to size or volume.

This study investigates various hypotheses relating to the potential effects of price restrictions. First, if price restrictions represent an economically meaningful constraint on short selling, they may induce some traders to avoid short selling or to reduce the size of their short positions. Thus, we test whether the level of short trading volume and short interest are significantly different for pilot and control stocks.[11] Both for Listed Stocks and Nasdaq NM Stocks, we find that price restrictions reduce the volume of executed short sales relative to total volume, indicating that price restrictions indeed act as a constraint to short selling. However, in neither market do we find significant differences in short interest across pilot and control stocks.

To the extent that price restrictions are applied in some markets and not in others trading the same stocks, traders who find the restrictions binding might avoid the constraint by choosing a venue where the constraint is not applied. Specifically, because not all markets that trade Nasdaq NM Stocks apply the Nasdaq Bid Test, short sellers can route their orders to avoid the rule. Removing the rule eliminates the need to avoid it and therefore might affect where short sales in Nasdaq NM Stocks are executed. Our results indicate that Nasdaq's share of short selling volume is negatively impacted by price restrictions, suggesting that some short sellers are routing orders to avoid price restrictions.

[11] Short interest is the total number of shares of a security that have been sold short and have not yet been repurchased.

Additionally, traders can avoid price restrictions by synthetically shorting in the option market rather than shorting the stock.[12] To measure the extent to which price restrictions drive short sellers to the option market, we compare option market trading activity for pilot and control stocks. We find no evidence that short sale price restrictions in equities have an impact on option trading or open interest.[13]

Regardless of whether price restrictions have any substantive impact on overall market liquidity or inhibit manipulation, they affect the ability of short sellers to demand liquidity by getting prompt execution of market orders. For purely mechanical reasons, we would expect price restrictions to affect the number of trades occurring on downticks vs upticks, and the percentage of time the market is in an upbid or downbid state. For Listed Stocks, we find that the application of the tick test results in significantly fewer than 50% of transactions occurring on downticks or zero downticks, while trading is more balanced when the tick test does not apply. For Nasdaq NM Stocks, we find that the percentage of time the market is in a downbid state declines when the bid test is removed, suggesting that downbids occur more regularly when the bid test applies.

To the extent that price restrictions inhibit the free movement of stock prices, they might make markets less liquid. On the other hand, because short sellers can rarely execute against a bid quotation, price restrictions force short sellers to act more like liquidity suppliers than liquidity demanders. Therefore, removing them might decrease the perceived supply of liquidity. To test whether price restrictions have a more general impact on liquidity or volatility, we compare quoted and effective spreads, intraday volatility, and the daily price range across

[12] A synthetic short position can be achieved by buying a put option and writing a corresponding call option in the same security. The term synthetic refers the fact that you can replicate the payoffs of an equity short sale without actually short selling the equity itself.
[13] Open interest is the total number of options contracts that have not yet been closed or fulfilled by delivery.

pilot and control stocks. We find that quoted depths are augmented by price restrictions but realized liquidity is unaffected. Further, we find some evidence that price restrictions dampen short term within-day return volatility, but when measured on average, they seem to have no effect on daily return volatility.

Finance theory predicts that under certain conditions, constraints on short selling may cause securities to be misvalued by the market, particularly when investors have highly divergent opinions about the stock.[14] A simple argument is that short sale constraints make it more costly for those investors who have a negative opinion of a stock to trade on their beliefs, and thus, their views may be reflected less in the stock price than those who have a positive view. Under more general assumptions, theoretic models predict that short sale constraints can cause stocks to be either overvalued or undervalued.[15] To test whether price restrictions constitute an economically consequential short sale constraint that influences equilibrium stock prices, we investigate whether the prices of pilot stocks react in response to the removal of the rule. We find that for Listed Stocks, control stocks outperform pilot stocks on average by about 24 basis points on the first day of the Pilot, suggesting that the tick test may cause stocks to be slightly overvalued. For Nasdaq NM Stocks, no significant return differential was observed surrounding the initiation of the pilot. We also examine stock returns for a six-month period following the initiation of the pilot program, to ascertain whether the elimination of price restrictions has had any discernible effect on stock prices over a longer horizon. We find that pilot stocks and control stocks have similar returns over this horizon, but some tests show weak evidence consistent with the hypothesis that price restrictions facilitate over-pricing. In the absence of price restrictions, prices do not rise as much as with price restrictions, leading to a lower equilibrium price.

[14] See, for example, Lintner (1969), Miller (1977), and Scheinkman and Xiong (2003).
[15] See Gallmeyer and Hollifield (2006).

SEC_OEA_FCIC_001553

One view of price restrictions is that they help prevent "bear raids," or that they make it more difficult for would-be manipulators to drive prices down below their true values. On the other hand, price restrictions might also make it more difficult for short sellers to move prices back toward their true value in response to upward manipulations. Because price restrictions are inherently short-term constraints, any substantive impact on the susceptibility of securities to manipulation is most likely to be manifest at short horizons. For this reason, we focus our investigation on price patterns that might indicate manipulative behavior at a daily or intraday frequency. To explore these issues, we proceed along three avenues of investigation.

First, to the extent that price restrictions create an environment less conducive to price patterns that might indicate downward manipulation and more conducive to price patterns that might indicate upward manipulations, we might expect to observe more extreme negative returns, and fewer extreme positive returns, for pilot stocks than for control stocks. To investigate this, we use our control-sample methodology to test whether the skewness of the returns distribution of short-horizon returns differs across pilot and control stocks.[16] Our results indicate no statistically significant impact of the pilot program on return skewness, measured at five-minute, thirty-minute, or one-day return intervals.

Second, we identify positive and negative price "spikes," or instances when extreme price moves are reversed shortly afterwards, and examine whether the frequency of positive and negative spikes differs across pilot and control stocks. We find that at a short (five-minute) horizon, pilot stocks tend to experience more price reversals than control stocks, but that this result is the same for negative and positive price reversals. At a thirty-minute horizon, we find no evidence that there are more price reversals for pilot stocks than control stocks.

[16] Bris, Goetzmann, and Zhu (2004), in a study of the effects of short sale regulations around the world, find evidence suggesting that short selling constraints can affect the skewness of the returns distribution.

SEC_OEA_FCIC_001554

Third, we use a time-series regression methodology to measure the extent to which positive and negative price changes are likely to be subsequently reversed. If price rules play an important role in preventing short sellers from temporarily driving prices down below their fair value, we would expect to see a larger portion of negative returns subsequently reversed for the pilot stocks than the control stocks. For Listed Stocks, we find that a larger portion of both negative and positive returns are subsequently reversed for pilot stocks than control stocks at a short (five-minute) horizon. The symmetry of these results is consistent with the increase in volatility discussed above rather than any marked increase in the potential for downward price pressure. On the other hand, a marked increase in the potential for downward price pressure relative to upward price pressure should lead to an asymmetry in positive and negative return reversal results. We do not find this asymmetry. At a thirty-minute horizon, we find no statistically significant difference in the magnitude of return reversals for Listed pilot and control stocks. For Nasdaq NM Stocks, we find no statistically significant difference in the magnitude of return reversals for pilot and control stocks for either five-minute or thirty-minute intervals.

One important element of the Pilot is the ability to examine whether the tick test affects stocks of varying sizes and volume differently. For example, does the tick test affect larger stocks in the same manner as smaller stocks and would the tick test be more effective for large or small stocks? To examine these questions, we divide the stocks into size, measured as market capitalization, and volume, measured as trading volume divided by shares outstanding (turnover), groups and run each of our tests again for each group. For most of our tests, we find that the tick and bid tests affect stocks the same no matter how large or small or how active are the stocks. In particular, we find that the tick and bid tests result in a lower percentage of short sale volume for most size and activity levels. We also find that the tick and bid tests result in

lower bid and ask depth for most size and activity levels. Thus, the bid and tick tests do not affect liquidity in a way related to the size or activity level of a stock. Finally, the tick and bid tests do not affect returns at or following the start of the Pilot whether the stocks are large or small. On the other hand, the size and activity levels appear to matter for the effect of price restrictions on volatility and for routing decisions. The bid test affects routing decisions more in smaller stocks. Likewise, the bid and tick tests dampen permanent price volatility in small stocks while amplifying it in large stocks.

The remainder of this report is organized as follows. In section II, we recount the history of price restrictions, including Regulation SHO. Section III contains an overview of the academic literature relating to the tick test and the bid test. The data and construction of the samples are described in section IV. Section V explains the empirical methods used in the analyses. In section VI, we present our main analysis of the effect of removing price restrictions for pilot and control stocks over the first 6 months of the Pilot Period. More specifically, in section VI-A, we present our analyses of how eliminating price restrictions has affected the overall level of short volume and short interest, option market volume and open interest, and the frequency and duration of upticks or upbids within the day. In section VI-B, we present our analysis of how the removal of price restrictions has affected market quality, including measures of spreads and intraday volatility. In section VI-C, we report our results on whether lifting price restrictions has affected underlying stock prices or returns, the skewness of returns distributions, the incidence of positive and negative spikes, and the tendency of positive and negative shocks to subsequently reverse. In section VII, we investigate whether price restrictions affect all stocks similarly or whether certain types of stocks, such as small stocks, are more affected by the rules. Section VIII summarizes and concludes the report.

II History of Price Restrictions

This section briefly summarizes the historical background of the price restriction rules.[17] After the market crash of 1929, a popular view emerged that short sellers exacerbated the crash.[18] Public concerns about short selling became particularly acute in the aftermath of the international currency crisis of September 21-22, 1931, prompting Senator Arthur Capper of Kansas to introduce several bills aimed at restricting and taxing short selling. It was in this environment, on October 6, 1931, that the NYSE required that all sell orders must be marked long or short.[19] According to Meeker (1932, p. 147), this effectively acted as a rule against shorting on a downtick, as such trades were viewed as violations of the Exchange's rule against "demoralizing" trades.[20]

Shortly after its creation in 1934, the Commission recommended sixteen rules that all national securities exchanges should adopt. Among them was a recommendation for an explicit rule against shorting on a downtick:

> No member shall use any facility of time exchange to effect on the exchange a short sale of any security in the unit of trading at a price below the last sale price of such security on the exchange.[21]

Exceptions were specified for odd-lot trading and to allow regional exchanges to bring their prices in line with the primary exchange. Sixteen exchanges adopted this rule in 1935.[22]

SEC_OEA_FCIC_001557

Following sharp price drops in the fall of 1937, the Commission performed a study of the transactions of 20 securities on the NYSE for the periods September 7-13 and October 18-23 of that year[23] and found that short sales constituted a significant portion of the transactions in the declining market. The Commission adopted new short-selling rules, including a rule to formally define what is meant by a short sale and Rule 10a-1, the tick test.[24] This version of the tick test prohibited short sales "at or below the price at which the last sale, regular way, was effected on such exchange." The rule was adopted on January 24, 1938 and went into effect February 8, 1938.

The tick test was amended March 10, 1939 to allow for short selling at a zero uptick, or in other words at the last trade price, "provided that the last sale price was higher than the last different price which preceded it."[25] Certain exemption letters have been granted over the years, such as the exemption for diversified exchange traded funds.[26] However, the basic structure of this rule has remained essentially unchanged since 1939.

The Commission's Special Study (1963) identified three objectives of the tick test, which have been consistently used by the Commission as a framework for discussing the effectiveness of the regulation. These objectives are that the rule should:

(1) Allow relatively unrestricted short sales in an advancing market;
(2) Prevent short selling at successively lower prices, thus eliminating short selling as a tool for driving the market down; and
(3) Prevent short sellers from accelerating a declining market by exhausting all remaining bids at one price level, causing successively lower prices to be established by long sellers.

[26] See, *e.g.*, Letter re: SPDRs (January 27, 1993); Letter re: MidCap SPDRs (April 21. 1995); Letter re: Select Sector SPDRs (December 14, 1998); Letter re: Units of the Nasdaq-100 Trust (March 3, 1999); Letter re: ETFs (August 17, 2001) (class letter).

In 1976, the Commission proposed three alternative temporary rules that would have suspended the tick test for some or all registered securities.[27] In response to the proposal, several market participants, including the NYSE, opposed the proposal, and expressed concerns that abolishing the tick test might lead to increased volatility or decreased liquidity. The Commission withdrew the proposals in 1980.[28]

A House Report submitted by the Committee on Government Operations dated December 6, 1991 discusses several aspects of short selling, including the tick test.[29] The report suggests that short selling has negative price effects that "can have important and lasting consequences" and asserts that the tick test is "effective in stabilizing the market for exchange-listed stocks for the benefit of issuers and investors," although no evidence is cited in support of this view. The report also recommends that the tick test should be extended to the Nasdaq market.

On September 6, 1994, the Commission approved NASD Rule 3350 (the "bid test") as a temporary rule.[30] This created a bid test for trades executed by NASD members or their customers, but with exemptions for both equity and option market makers. Specifically, this rule prohibited short sales at or below (or less than one penny above) the best bid price whenever the prevailing inside bid price is lower than the previous inside bid. The bid test might appear less restrictive than the tick test, because it allows for unrestricted short selling at any price when the bid price is higher than the previous bid, and because of the market maker exemptions. Since its

SEC_OEA_FCIC_001559

initial approval, the bid test has been re-approved annually as a temporary rule.[31] The bid test was in effect when Regulation SHO became effective in January 2005. When Nasdaq began operating as an exchange in August 2006, NASD Rule 3350 was replaced by Nasdaq Rule 3350 and NASD Rule 5100.[32]

The Commission re-opened the discussion on Rule 10a-1 in a concept release dated October 20, 1999.[33] In this release, the Commission requested comment on numerous issues surrounding the tick test, including:

- whether the tick test should be suspended when the daily stock return is above a threshold level;
- whether actively traded securities should be exempted from the tick test;
- whether the restrictions should apply only around certain market events such as at the open and close, around mergers and acquisitions, or at option expirations;
- whether hedging transactions be exempt from the tick test;
- whether the tick test should be revised in response to expanded after-hours trading or decimalization;
- whether the tick test should be extended to non-exchange-listed stocks; and,
- whether the tick test should be eliminated.

In October 2003, the Commission proposed a rule that would create a uniform bid test that would apply to both Listed and Nasdaq NM Stocks, with various exemptions.[34] In addition, the Commission proposed a pilot program that would suspend the tick test for actively-traded securities for two years.[35] As stated in the proposing release, "[t]he temporary suspension would allow the Commission to study the effects of relatively unrestricted short selling on market volatility, price efficiency, and liquidity."[36]

---

[31] Most recently, see SEC Release No. 34-53093, January 10, 2006.
[32] Nasdaq NM stocks are currently trading under an exemption from Rule 10a-1 in order to maintain the status quo until the conclusion of the Pilot or any further rulemaking by the Commission.
[33] See SEC Release No. 34-42037, October 20, 1999.
[34] See SEC Release No. 34-48709, October 28, 2003.
[35] See SEC Release No. 34-48709, October 28, 2003.
[36] See SEC Release No. 34-48709, October 28, 2003.

With the adoption of Regulation SHO in July 2004, the Commission decided to defer consideration of the uniform bid test and the proposed exemptions (proposed Rule 201), in order to first observe the results of the pilot program.[37] In connection with the establishment of a Pilot, the parameters governing a Pilot were expanded to include a broader spectrum of securities than envisioned in the proposing release, and the length of the Pilot was shortened to one year. As stated in the adopting release,

> the purpose of the Pilot is to assist the Commission in considering alternatives, such as: (1) eliminating a Commission-mandated price test for an appropriate group of securities, which may be all securities; (2) adopting a uniform bid test, and any exceptions, with the possibility of extending a uniform bid test to securities for which there is currently no price test; or (3) leaving in place the current price restrictions.

The details of the program, including the list of securities included in the Pilot, were specified in the Commission's Pilot Order of July 28, 2004.[38] The Pilot was originally scheduled to begin on January 3, 2005 and last for one year. However, because the industry needed more time to prepare their systems, the start date was postponed until May 2, 2005, and later, the terminal date of the Pilot was extended until August 6, 2007 to maintain the status quo for pilot stocks until the Commission evaluates the results of the study and considers potential rulemaking on price restrictions.[39] The Pilot Order suspends Rule 10a-1 and the bid test for approximately a third of the Russell 3000 stocks. The methodology for selecting the pilot stocks is detailed in the Pilot Order, and is summarized in section IV, below.

III Previous Evidence

The previous evidence on price restrictions gives us insight into how price restrictions work. In particular, it examines the effectiveness of the rules and the effect that the rules have on

[37] SEC Release No. 34-50103, July 28, 2004.
[38] SEC Release No. 34-50104, July 28, 2004.
[39] SEC Release No. 34-53684, April 20, 2006.

SEC_OEA_FCIC_001561

market quality. We are unaware of a previous study that compares the tick test to the bid test. Several concurrent studies also examine the effect of the Pilot on the tick and bid tests (Alexander and Peterson (2006), Bai (2006), Diether, Lee, and Werner (2006), and Wu (2006)). These studies are summarized on Appendix A.

A. Effectiveness of the Rule

1. Shorting in a Declining Market

Several studies examine whether the rules appear to keep short sales from executing in declining markets. When Rule 10a-1 was adopted in 1938, it was motivated in part by a Commission study of short selling, based on two weeks of data in 1937. This study found that when a downtick rule applied, a substantial amount of short selling occurred during periods when the market was declining.[40] Two subsequent studies produced by staff at the Commission found that the tick test allows short selling in declining markets.[41] The Commission's 1963 Special Study concluded that Rule 10a-1 was not effective at achieving its objectives, stating that

> [p]resent rules appear inadequate to relieve the added pressure that short selling may create during a severe decline in the general market or a declining price trend in a particular security. Despite the rules, a relatively large volume of short selling occurred in particular stocks, including "market leaders" and "trading favorites," during the period of decline preceding the market break of May 28, 1962, and at critical junctures on that day, and many additional opportunities existed when short selling could have occurred.[42]

In a more recent study, Ferri, Christophe, and Angel (2004) examine short selling in a matched sample of Nasdaq National Market stocks, which were subject to the bid test, and Nasdaq SmallCap stocks, which were not, during a period of high volatility and rapidly declining

[40] The NYSE had a downtick rule prior to the Commission's tick test. A downtick rule is a weaker form of the tick test because it allows trading at the most recent price even if that price was a downtick.
[41] The Securities and Exchange Commission (1963), in the Special Study, examined the trading activity leading up to and during the market break of May 28, 1962. In a working paper by SEC staff, Marcotte and Martin (1977) study the tick test for the period from September 20 through October 15, 1976, during which time the Dow Jones Industrial Average fell by 8.12%. The results are summarized in Pollack (1986).
[42] 88th Congress, HR Doc No 88-95 (1st session, 1963), pp. 293-294.

SEC_OEA_FCIC_001562

stock prices (September 2000-August 2001). In their sample of 2,275 observations, they find no significant differences in the overall level of short selling, or the frequency of days with abnormally negative returns and abnormally high short selling.

Overall, the research above shows that short sales are executed in declining markets despite the application of the tick or bid tests. However, this does not mean that short sales are unaffected by the tick and bid tests. We discuss this further in the next section.

2. Short Sale Execution Quality

Another area of research examines whether these rules harm the execution quality of short sales by reducing the prices received by short sellers, by delaying the execution of short sales, or by reducing the fill rates.

Martin and Marquette (1977) conduct a simulation calibrated to the Dow 30 stocks, to estimate the degree to which the rule would have affected execution prices for market short sale orders submitted during a period of market decline. The simulation results indicate that even during a period of rapid price declines, randomly arriving short market orders would have executed at higher prices as a result of the uptick rule. Therefore, short sellers appear better off because of the tick test.

Albert, Smaby, and Robison (1997) examine the negative abnormal returns to stocks following large increases in reported short interest, as an estimate of the profitability of short selling. They find that short selling was more profitable for their Listed sample than their Nasdaq sample during a period (1987-1991) when only Listed Stocks were subject to a price restriction. Their findings imply that the uptick rule does not have a significant negative impact on the bottom line for short sellers.

While studying order data from the NYSE, Angel (1997) and Alexander and Peterson (1999) find that the tick test prevents short sales from demanding liquidity more than 90% of the time. As expected, the degree to which the tick test is binding depends on whether the market is rising or falling. Likewise, McCormick and Reilly (1996) find that the Nasdaq bid test prevents short sellers from demanding liquidity roughly 35% of the time. This proportion was found to be an increasing function of trading volume and, not surprisingly, a decreasing function of the day's stock return.

Both Angel (1997) and Alexander and Peterson (1999) conclude that Rule 10a-1 significantly impedes order execution quality for short sales, even in rising markets. For those cases where the stock price increased, short sellers can trade at the bid less than fifteen percent of the time. According to Alexander and Peterson (1999), the tick test appears to contradict the Commission's first stated objective for short selling regulation, to "allow relatively unrestricted short selling in an advancing market."

In addition, Alexander and Peterson (1999) also found that short sale orders have significantly lower execution rates and significantly longer times to execution than regular sales. Alexander and Peterson (2002) study how the tick test was affected by the reduction of the tick size from 1/8 to 1/16 in June 1997. As predicted, their evidence suggests that short sales were executed faster and at better prices after the reduction in tick size, confirming that the tick test is less binding when the tick size is smaller.

In summary, previous research shows that short sellers can receive better prices as a result of the tick test and that the tick test does not impede profit opportunities. However, the tick test and bid test restrict the ability of short sellers to demand liquidity even in rising markets.

This results in execution delays and lower fill rates. Tick size changes have lowered these costs, but short sellers are still precluded from demanding liquidity much of the time.

3. Manipulation

Many of the studies that examine the ability to short in a declining market do not address the question of whether short selling in a declining market increases the potential for manipulating a stock price below its fair value, or conversely, whether short selling helps prices adjust more quickly to their efficient values. Nor do the studies address the question of whether a tick test or bid test would have been effective at reducing the amount of short selling during declining markets. A few early studies of short selling in the 1930s concluded that there was no evidence that short sales had any material effect on the magnitude of price swings.[43]

Ferri, Christophe, and Angel (2004) come a little closer to questioning whether the bid test inhibits trading that may be indicative of manipulation. On days when stock prices are declining, the degree of short selling is positively related to returns for Nasdaq SmallCap stocks, which are not subject to the bid test, but not for matching Nasdaq NM stocks, which are subject to the bid test. This result is the reverse of what one would expect to see if the bid test helps prevent short sellers from pushing down prices. The authors conclude that "a bid test is unnecessary for investor protection."

B. Effect on Market Quality

Because the tick and bid tests appear to have some impact on the execution of short sales, even though short sales can still execute in declining markets, we might expect the tick and bid test to affect market quality. In a recent working paper, Jones (2003) re-examines the period surrounding the initiation of the tick test in the 1930s. He finds a significant reduction in bid ask

[43] See Twentieth Century Fund (1935), Macaulay and Durand (1951).

SEC_OEA_FCIC_001565

spreads and positive abnormal stock returns surrounding the initiation of the downtick rule on October 6, 1931, with no significant changes in trading volume, volatility, or the price impact of trades. He also finds similar results surrounding the initiation of Rule 10a-1 1938. He concludes that

> [b]ecause the uptick rule no longer constrains shorting as much as it once did, any liquidity effects are likely to be much more modest than the ones identified in the 1930's. However, it would not be surprising if repeal of the uptick rule were to lead to some reduction in individual stock liquidity, particularly in less liquid stocks.[44]

In research sponsored by NASD, McCormick and Reilly (1996) find that the introduction of the bid test did not have a substantive impact on market quality, as measured by volatility and bid ask spreads. A more comprehensive follow-up study by McCormick and Zeigler (1997), which was also sponsored by the NASD, supports the original finding that the implementation of the bid test had little or no impact on market quality. They find that quoted and effective spreads were narrower in 1997 than in 1994, but they attribute the changes to a gradual improvement in market quality over time, and not to the implementation of the bid test. They find no significant change in quoted spreads as a result of the bid test. While they do find a statistically significant decline in effective spreads, this is a natural consequence of a rule that forces short sellers to act as liquidity suppliers rather than liquidity demanders. Because the improvement in effective spreads is coming at the cost of delayed executions, it does not necessarily signify an improvement in market quality.

Au-Yeung and Gannon (2003) estimate the joint dynamics of index and index futures returns in Hong Kong, surrounding the elimination of Hong Kong's uptick rule on March 25, 1996. Using a multivariate GARCH framework, they find evidence that Hong Kong's uptick

[44] This study was funded by the New York Stock Exchange.

SEC_OEA_FCIC_001566

rule was impeding price discovery on the index relative to the futures contract, and that conditional volatility for the index declined with the elimination of the uptick rule.

Overall, this evidence seems to indicate that tick tests can lead to narrower bid ask spreads, but impedes price discovery, while the bid test should not have any discernable effect on market quality. The construction of the Pilot study improves upon the design of these previous studies and allows us to study these issues in a more controlled environment.

IV Construction of the Samples

A. Selection of Pilot and Control Stocks

The stocks in the pilot sample are those specified in the Pilot Order.[45] Stocks were selected for this sample by sorting the 2004 Russell 3000 first by listing market and then by average daily dollar volume from June 2003 through May 2004, and then within each listing market, selecting every third company starting with the second. Because the selection process relied on average daily dollar volume, companies that had their initial public offering in May or June of 2004, just prior to the Russell reconstitution, were not included. The 32 stocks that are not listed on the NYSE, Amex, or Nasdaq NM were also excluded prior to sorting and selecting the pilot stocks.

While no companies have moved in and out of the Pilot, the pilot stocks might experience ticker symbol changes, listing changes, and mergers. We collected the necessary change information from NYSE, Amex, and Nasdaq, who keep track of and disseminate these changes. In the case of mergers between pilot and control stocks, the status of the resulting company is the same as the status of the company with the larger market capitalization of equity on the day prior to the first merger announcement. The pilot stocks that did not survive to the start of the Pilot on

[45] SEC Release No. 34-50104, July 28, 2004.

SEC_OEA_FCIC_001567

May 2, 2005 are not included in the analysis. Pilot stocks with listing changes during the Pilot are included in our analysis up until the date of the listing change.

The stocks in the control sample come from the remainder of the 2004 Russell 3000 not included in the Pilot. We do not include the stocks with initial public offerings after May 2004 because these stocks were not eligible to be selected for the Pilot. Like the pilot sample, the control sample stocks can experience corporate events that make tracking them difficult. We keep track of ticker symbol changes, listing changes, and mergers using the daily symbol directories from the Nasdaq Trader web site and using Bloomberg. As with the pilot sample, we include only the control stocks that survive until May 2, 2005 and include stocks that are subsequently delisted up until the delisting date.

Table 1 reports the sample sizes and breaks down the sample in various dimensions. As the table indicates, our sample contains 504 listed pilot stocks and 973 listed control stocks that are subject to Rule 10a-1 and 439 Nasdaq pilot stocks and 917 Nasdaq control stocks that are subject to NASD Rule 3350. Table 1 also indicates that roughly 70% of Listed Stocks and 63% of Nasdaq NM Stocks have listed options. Because listing affects the short sale rules applied to trading, we report results for sub-samples by listing market but not for the full sample. If an issuer switches its listing from Nasdaq to Amex or NYSE or vice versa after May 2, we keep that stock in the sample up until the day of the listing change. If an issuer changed its listing prior to May 2, it will be grouped according to its new listing and we include pre-period data only from that same listing.[46] Listings changes between Amex and NYSE do not affect our sample because the change does not affect the short sale rule applied.

[46] We exclude one stock that changed its listing on the first day of the pilot, Renasant Corporation RNST, formerly Peoples Holding Company, PHC.

Similarly, we keep stocks in our sample up until their last listed day even if they are acquired or otherwise move to markets that do not apply the same rule (i.e., move to the Nasdaq Capital Market, OTCBB, or the Pink Sheets) after May 2, 2005. We keep these stocks to avoid a survivorship bias, which is a bias associated with finding higher average returns than actually exist. We believe an analysis of the pilot would be particularly sensitive to survivorship bias and we therefore, make every effort to reduce it. Further, if an issuer moves its listing from Nasdaq to an exchange or from an exchange to Nasdaq, we keep the stock in the sample up until the list/delist date. We do this so that our analysis does not confuse the effects of the tick test with those of the bid test. Because we retain stocks in our sample until the stocks delist, our sample size on our last sample day (October 31, 2005) is smaller than our sample size on the first pilot day (May 2, 2005). In fact, we have about 88 fewer stocks in our sample on October 31 than we do on May 2. Despite the drop in sample size, the pilot stocks comprise about 1/3 of the sample stocks for both Listed and Nasdaq NM Stocks on October 31 as well as May 2.

B. Data and Sample Statistics

We examine these pilot and control stocks over a 210 day period in 2005. We examine the 82 day period from January 29 to April 29 as the Pre-Pilot Period during which the pilot and control stocks are subject to the same rules. The Pre-Pilot Period allows us to test whether the pilot and control stocks appear similar when they are subject to the same rule and it gives us a reference point to examine how the sample stocks change when the price restriction rules are removed. In the results section, this period is compared to the 128 day period from May 2, the first day of the pilot, to October 31, 2005.

Before comparing the Pre-Pilot Period to the Pilot Period, we first examine whether the pilot and control samples appear comparable over the Pre-Pilot Period. Table 2 gives this comparison separately for Listed and Nasdaq NM Stocks. The statistics are daily levels averaged over the Pre-Pilot Period. We use trade and quote data obtained from the Securities Industry Automation Corporation (SIAC) to estimate stock volume, price, spread, depth, and intraday returns, data from the Center for Research in Securities Prices (CRSP) to estimate market capitalization and daily returns, data from the Option Price Reporting Authority (OPRA) to estimate option volume and open interest, and the SRO Pilot data to estimate short selling levels.[47] Short interest, reported monthly, comes from the NYSE, Amex, and Nasdaq. Most of the measures in Table 2 are qualitatively similar for pilot and control stocks, according to a statistical t-test run at the 95% and 99% confidence levels (also stated as 5% and 1% significance levels). This evidence suggests that the two groups are a good match and supports the validity of further comparison of pilot and control stocks.

The statistics of Table 2 are divided into groups. The first group of statistics measures general stock characteristics such as volume, price, market capitalization, and short interest. The first three rows of Table 2 show that the pilot stocks have similar average volume to the control stocks whether volume is measured by the number of trades per day, the average daily share volume, or turnover. The average volume-weighted average price (VWAP) and average market capitalization diverge slightly. For both Listed and Nasdaq NM Stocks, the VWAP is higher for pilot stocks but the market capitalization is lower. Neither difference is statistically significant.

[47] The SRO Pilot data refers to the short selling records available from each of nine markets: American Stock Exchange, Archapelago Exchange (now a part of NYSE Group), Boston Stock Exchange, Chicago Stock Exchange, NASD, NASDAQ Stock Market (now NASDAQ Stock Exchange), New York Stock Exchange (now a part of NYSE Group), National Stock Exchange, and the Philadelphia Stock Exchange. This analysis aggregates the short selling data without regard to whether there exists a SIAC report for the short sale transaction.

The next group of statistics measures the level and nature of short selling. These statistics measure short interest, the short selling volume and location, and option volume and open interest. In Listed Stocks, short selling comprises about 24% of share volume and 27% of trades. The level jumps to 36% of share volume and 37% of trades in Nasdaq NM Stocks. Still, the level of short selling in pilot stocks is similar to that of control stocks prior to the start of the pilot. Because the bid test does not apply to all markets, we examine the share of short sales executed on Nasdaq to measure whether investors appear to be routing short sales away from Nasdaq. While we estimate this statistic for Listed Stocks as well, we focus on the Nasdaq NM Stocks for results. Rows ten to fifteen of Table 2 show that prior to the pilot, the pilot and control stocks have similar average option volume and open interest, statistically indistinguishable from each other.

The next set of statistics measures mechanical aspects of trading and quoting, in particular, the percentage of trades occurring on a downtick or zero downtick and the percentage of the day during which the last change in the bid was downward. These measures were selected because they both determine when a short sale can be executed and are influenced by the application of the price restrictions. Prior to the pilot, about 46% of trades in Listed Stocks occur on downticks or zero downticks, while slightly over 50% of trades in Nasdaq NM Stocks do. These percentages are similar for the pilot and control stocks. Likewise, the percentage of the day during which the most recent change in the bid was downward is similar for pilot and control stocks. For Listed Stocks, the most recent change in the bid was downward for about 39% of the day. This is indicative of the nature of a limit order book market to have short-lived liquidity imbalances followed by long periods of liquidity building. In other words, a large order quickly executes, removing several price levels in the limit order book, followed by a slow replenishing

of the limit order book. In the Nasdaq market, which operates more like a dealer market than the listed market, stocks spend more time in a downbid situation, about 47% of the time.

Liquidity is the next important group of statistics. We measure displayed liquidity using quoted and effective spreads measured in absolute terms and also relative to prices, and using aggregated quoted ask and bid depth at the National Best Bid and Offer (NBBO). We measure realized liquidity using the NBBO for both Listed and Nasdaq NM Stocks. Like the earlier measures, the liquidity measures show that the pilot and control stocks are statistically similar for all measures. While the magnitude of some of the measures, particularly the quoted ask depth and quoted bid depth, appears higher for control stocks than for pilot stocks, the measures are actually statistically similar.

The final group of statistics gives the distribution of returns and prices over various periods. Table 2 gives average returns, average absolute returns, the skewness of the returns, and the variance of the returns over 5 minute, 30 minute, and 1 day periods. It also shows the daily price range and three variance ratios. The variance ratios measure the transitory volatility by comparing the variance of returns measured over short and long horizons. Overall, the pilot and control samples are statistically similar in the means, skewness, and transitory and total volatility. It is interesting to note that the returns for all samples and all horizons are positively skewed. This positive skewness has been documented in previous work, which associates the result with short selling restrictions.

V Methods

A. Comparing Pilot and Control Stocks

We derive the results in this report using several empirical approaches. The first approach compares the pilot sample to the control sample both before and after the start of the pilot. The approach allows us to apply a standard t-test to the difference of the differences. As long as the pilot and control samples are generally well constructed, this approach will control for changes in market conditions that are unrelated to the pilot. However, this approach may not fully control for differences within the samples. Further, it is cumbersome when examining the differential effect of the pilot on sub-samples. Therefore, we will also employ a regression approach.

The regression approach includes multiple test variables at the same time and also controls for unforeseen differences between the pilot and control samples. Because the number of stocks changes over the sample period, we employ daily cross-sectional regressions for each sample day after the start of the pilot and then we average the coefficients. We employ variations on the following regression:

$$\text{Market Quality}_i = \alpha + \beta_1 \text{Pilot}_i + \beta_2 \text{Pre Pilot Market Quality}_i \quad (1)$$

where Market Quality is one of several dependent variables (e.g., effective spread) measured for each stock on one trading day, Pilot is equal to one for pilot stocks and zero for other stocks, and Pre-Pilot Market Quality is the average daily level of the dependent variable measured over the Pre-Pilot Period. If the dependent variable is generally larger for pilot stocks than control stocks, then β_1 will greater than zero. If this relation is persistent across time, then the average β_1 will be greater than zero. The Pre-Pilot Market Quality variable helps ensure that the coefficients on the

SEC_OEA_FCIC_001573

indicator variables measure the effect of removing price restrictions. It also helps to control for any unforeseen differences between the pilot and control stocks.

We run all tests separately for stocks listed on an exchange and stocks listed on Nasdaq NM because the rule applied to trading of Nasdaq NM Stocks is different than the rule applied to the trading of stocks listed on exchanges.[48] This allows us to satisfy one purpose of the Pilot, which is to clearly distinguish the effect of each type of rule.

B. Behavior of Stock Prices Surrounding the Pilot Initiation

In order to evaluate whether the tick test or the bid test affects the level of stock prices, we examine average daily returns and average cumulative returns for pilot and control stocks over a 21-day period surrounding the beginning of the pilot. If pilot stocks are over-valued because of the price restrictions these returns should be significantly negative for pilot stocks relative to the control stocks on or around the first day of the pilot. Cumulative returns are normalized to zero on April 29, the trading day prior to the start of the pilot.

We believe it likely that any valuation effects of the pilot that are not already impounded into the price before the start of the pilot would most likely be observed immediately upon the initiation of the pilot, and reflected in the returns on the first day. However, we also consider the possibility that the effects of the pilot might be manifest over a longer time period. Therefore, we also examine returns over a six month time horizon. To avoid a survivor bias, we compound returns to the six month horizon if a stock falls out of the sample prior to October 31, 2005. In addition, to control for the systematic risk of a stock, we estimate an alpha for each stock. We estimate these alphas in-sample using the market model:

[48] It is worth noting that neither the bid test nor tick test applies to the trading of Nasdaq NM stocks on exchanges.

$$R_t = \alpha + \beta R_{Mt}$$

where R_t is the return on the stock in day t, and R_{Mt} is the equally-weighted market index return from CRSP for that day. We also estimate the tendency of the alphas to be significantly positive or negative. Pilot stocks might be more likely to have negative alphas than control stocks if either price restrictions corrected over-pricing over long horizons or if price restrictions prevent constant short selling pressure from pushing prices below their equilibrium level. Pilot stocks might be less likely to have positive alphas if price restrictions facilitate over-pricing.

C. *Measuring Large Price Reversals*

As part of our analysis of whether price restrictions inhibit price patterns that may be indicative of short-term price manipulation, we wish to examine the frequency of large short-term price movements that are immediately reversed. Although such price reversals, or "spikes," are bound to occur with some frequency due to the natural variation of prices, they may also be a sign of price manipulation. If the price patterns indicative of manipulation are more prevalent on the short side than on the long side, we would expect to see more negative price spikes than positive ones. And if price restrictions are effective at reducing the potential for price manipulation, we might expect to see significantly more price spikes for pilot stocks than control stocks.

To investigate this, we define the following measures of short-term price reversals:

$$Negative: \min(-R_{t-1}, R_t^L)/\sigma_i$$
$$Positive: \min(-R_t^L, R_{t-1})/\sigma_i$$

In these formulas, σ_i represents the holding period (non-annualized) standard deviation of returns on stock *i,* measured using data in the Pre-Pilot Period, R_t is the simple one-period return

on stock i at time t, and R_t^L is the one-period return measured as a percentage of the lagged stock price:

$$R_t = \frac{P_t - P_{t-1}}{P_{t-1}} \qquad R_t^L = \frac{P_t - P_{t-1}}{P_{t-2}},$$

where P_t represents the price of stock i at time t. We estimate these metrics using 5-minute and 30-minute horizons. The return as a percentage of the lagged price is used in the measure so that the adjacent returns will be compared on the same basis.[49]

We normalize the reversal measure by the standard deviation of returns on the same stock, computed using the same return interval over which the reversals are measured, in order to ensure that the measure will capture reversals that are large in magnitude compared to the typical movement on the stock. The standard deviation is computed using only pre-pilot returns data, so that the measure will not be affected by any changes in volatility that may be related to the pilot.

By definition, a "negative reversal" only occurs in periods when there is a negative return followed by a positive return—otherwise, the negative reversal measure is equal to zero. If a stock experienced a negative return of 3 standard deviations that was fully reversed in the next period, our negative reversal measure would be 3. If a return is only partially reversed, only the portion that is reversed is counted in the measure.

We do not test whether this measure changes across Pre-Pilot and Pilot Periods because the Pre-Pilot Period is already used to normalize the measure. Rather, we focus on differences between the control and pilot samples during the Pilot Period. In order to test whether the frequency of extreme reversals differs across the two samples, we use a nonparametric bootstrapping methodology that does not require any assumptions about the probability

[49] For example, if a stock price increases from 40 to 50 and then returns back to 40, this corresponds to a 25% return followed by a -20% return. In our measure, we would compute the negative return as a percentage of the original price, which would make it a -25% return.

distribution of returns or return reversals. Essentially, this method estimates the likelihood of observing a particular number of reversals under the null hypothesis that the distribution of reversals in the pilot sample is the same as the distribution in the control sample. This is implemented as follows. For a given "threshold" level of the reversals measure, we count the number of reversals in the pilot sample that exceed that threshold. We then select from the control sample (with replacement) a random sample of reversals equal in size to the pilot sample. Within this randomized sample, we count the number of reversals exceeding the threshold, and observe whether the number is higher or lower than the number observed in the pilot sample. We repeat the process 1,000 times and observe the frequency with which the number of reversals in the randomized control sample equals or exceeds the number in the pilot sample. We report the significance based on a two-tailed test—for example, the number of reversals in the pilot sample would be deemed significant at the five percent level if a number that high occurs 2.5% of the time or less in randomized control samples.

D. Autoregression Methodology for Measuring Reversals

As an alternative approach to measuring the impact of the pilot on price reversals, we employ a new methodology. Similar in spirit to autoregression, this methodology involves measuring the extent to which positive and negative price movements reverse in subsequent periods. Specifically, we use intraday returns to estimate a model of the form:

$$R_t = \sum_{n=1}^{5} \alpha_n R_{t-n}^{-} + \sum_{n=1}^{5} \beta_n R_{t-n}^{+} .$$

In this equation, R_t represents the stock return in period t, and the regressors are the positive and negative components of lagged returns:

$$R_t^{-} = \min(0, R_t) \qquad R_t^{+} = \max(0, R_t) .$$

SEC_OEA_FCIC_001577

The estimated α and β coefficients measure the extent to which positive and negative returns tend to reverse or continue in subsequent periods. In a world where stock prices follow a random walk, the true coefficients would be equal to zero. Unlike an ordinary autoregression, this specification permits the degree of momentum or reversals to differ for positive and negative shocks. In either case, positive coefficients would indicate that returns exhibit short-term momentum, while a negative coefficient would indicate short-term reversals. For example, if the coefficients α_1 and α_2 were estimated to be -0.05 and -0.01, this would mean that a negative return of one percent would, on average, be followed by a positive return of five basis points in the next period, and a positive return of one basis point in the period after that. If the coefficients β_1 and β_2 were estimated to be -0.04 and -0.02, this would indicate that a positive return of one percent would on average be followed by negative returns of four and then two basis points in the next two periods. We are interested in comparing these coefficients for pilot and control stocks. If price restrictions help prevent short-term negative stock price manipulations, we would expect to see the α coefficients higher for pilot stocks than for control stocks.

E. Small and Low-Volume Stocks

One policy alternative outlined in the first Pilot Order was to extend a uniform test to all securities, including securities with a lower market capitalization or less actively traded than those included in the Pilot. While our analysis cannot directly investigate the effects of price restrictions for stocks beyond the range covered by the pilot sample, it can provide relevant evidence by investigating whether the impact of the Pilot has been substantially different for the smaller stocks than for the larger stocks in the Pilot, or whether the impact has differed for

actively traded and less actively traded issues. To examine these questions, we run a series of regression-based tests of the following form:

$$\text{Market Quality}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i + \beta_{11} \text{Pre Market Quality}_i$$

where "Market Quality" represents a characteristic of interest such as spreads, depth, or volatility. The "Decile" variables are indicator variables corresponding to each of the nine lowest deciles, for two different decile partitions. The first partition ranks stocks by market capitalization on April 28, 2005. The second partition ranks stocks by annualized turnover in the Pre-Pilot Period as measured by its average daily share volume divided by its shares outstanding as of April 28, 2005 and multiplied by 250. In each case, the decile indicators take on a value of one if the stock falls within the designated decile, and zero otherwise. These partitions allow us to test whether the price restrictions have a larger impact on certain categories of stocks. In particular, we examine each $\beta_{10} + \beta_k$ to measure whether the pilot has a significant effect on stocks in decile *k*.

VI Results and Analysis

A. The Nature of Short Selling

1. Short Selling Activity

Price restrictions may impose costs on short sellers in the form of lower fill rates and delays on execution. If these costs are economically significant, then we would expect the removal of the price restrictions to result in increased short selling. We would expect short selling to increase more for pilot stocks than control stocks if the price restrictions are costly, or be the same for the pilot and control stocks if price restrictions are not costly.

Table 3 shows how removing the price restrictions affects the level of short selling, based on three different measures, including (i) the number of shares sold short on a given day divided by the total share volume, (ii) the number of trades involving short sales, and (iii) short interest.[50] Panel A shows the Pre-Pilot Period to Pilot Period comparison while Panel B reports the average coefficients from regression analysis. In the Listed market, short volume increases significantly from 24.4% to 26.3% of total volume in the pilot sample, while the change is not statistically significant for the control sample. A comparison of these two changes reveals that short selling volume increases by about 2% of total volume as a result of removing the tick test, suggesting that the tick test imposes economic costs on short sellers. The same conclusion can be drawn from the statistics on short selling as a percentage of trades.

Similarly, both volume and trade measures for Nasdaq NM Stocks suggest that the application of the bid test reduces short selling. The regression analysis in Panel B confirms these conclusions and also shows that the effect of the tick test is stronger than the effect of the bid test.

Although our results indicate that price restrictions appear to constrain the volume and frequency of short sales, these effects are not reflected in short interest. As indicated in Table 3, both pilot and control stocks exhibited significant increases in short interest around the time of the Pilot Period. However, none of the tests indicate any significant difference between pilot and control stocks. Both the univariate results in Panel A and the regression-based results in Panel B lead to the same conclusion: price restrictions appear to have no effect on short interest for Listed

[50] Though not reported, OEA found that pilot stocks were less likely to qualify for the Regulation SHO threshold list than control stocks. This result rejects the conjecture that removing price tests leads to more settlement failures. In order to maintain a focus on the price tests, analysis of the Regulation SHO threshold list is not included in this report.

SEC_OEA_FCIC_001580

Stocks or for Nasdaq NM Stocks. The same result is observed whether short interest is measured in percentage of shares outstanding or in "days to cover."

The fact that we document statistically significant increases in short selling volume but not in short interest can be interpreted in various ways. One interpretation is that the increase in short volume is due primarily to increased short selling by parties that close out their short positions within the day—or, more generally, that the increase in short volume was accompanied by a decrease in the average horizon over which short positions are held. We should also note that the absence of a statistically significant result does not imply that no change occurred. Given that we observe short interest only monthly, it is possible that our statistical test did not have sufficient power to detect a change in short interest.

Because short sales in Nasdaq NM Stocks executed outside of the Nasdaq market are not subject to the bid test, short sellers can avoid the bid test by sending orders to markets other than Nasdaq. The removal of the bid test might result in an increase in short sales on Nasdaq in Nasdaq NM Stocks because the order routing decision might no longer be affected by the application of the bid test. The Nasdaq market share statistics in Panel A of Table 3 show that Nasdaq's market share in short sales increased 3.9% in pilot stocks and by 1.3% in non-pilot stocks. The difference of 2.6% is statistically significant, which is consistent with the non-uniform application of the bid test altering order routing decisions.

2. Option Activity

If price restrictions drive short sellers to trade options in lieu of stocks, then their removal should decrease option activity. Table 4 summarizes the changes in option trading for pilot and control stocks between the Pre-Pilot Period and Pilot Period. There are a total of 628 pilot and

1,263 control stocks that had listed options included in the analysis. Put and call option trading volume is aggregated over all classes and markets for each underlying stock on a daily basis. Then, the put and call option trading volume is averaged across days for each stock for period before the pilot and for the period of the pilot. The change in put option trading volume is calculated as the average daily put (call) volume during the pilot minus the average daily put (call) volume before the pilot. Finally, the change is averaged across stocks to yield the results reported in Table 4. Averaging across stocks allows us to maintain the independence of the observations and perform a t-test comparing the mean of the pilot stocks to the mean of the control stocks. The results for open interest and signed option volume use the same methodology.

If the price restriction drives would-be stock short sellers to trade options to implement their investment strategies, then the lifting of the price restrictions on the pilot stocks would lead to a significant decline in option trading for pilot stocks relative to the control stocks. As indicated in table 4, between the Pre-Pilot Period and Pilot Period, we do observe a slight increase in average trading volume for calls and puts on Listed Stocks, a decrease in average trading volume of calls and puts on Nasdaq NM Stocks, and an increase the average open interest of all categories. Based on the paired *t* test, however, we find no statistically significant changes at the 5% confidence level. We also observe that open interest increased less on average for control stocks than for pilot stocks, but again, based on the two-sample *t* test, we find no statistically significant differences between the changes in the pilot and control samples.

As an additional measure, we examine signed option volume. This is computed by subtracting the change in the put volume from the change in the call volume. A positive signed option volume suggests either an increase in long side buyer speculation or a decrease in short

side seller speculation. A negative signed option volume suggests either a decrease in long side buyer speculation or an increase in short side seller speculation. For example, if the change in the call volume is -10 and the change in the put volume is -5, then the signed option volume equals -5. On the other hand, if the change in the call volume is -5 and the change in the put volume is -10, then the signed option volume is 5. Again, we find no significant difference between pilot and control stocks.

Since short sellers may use short-term options in lieu of equity short sales, Table 4, Panel B shows the results for short-term options only.[51] The results are quantitatively similar to the results in Table 4, Panel A. Thus, the conclusions drawn from Table 4, Panel A hold for short-term options.

Overall, the options market results provide no statistical evidence supporting the hypothesis that the tick test drives would-be short sellers away from the equity markets and to the options markets to trade.[52] Option trading volume of pilot Nasdaq NM Stocks show a decline in option volume relative to control stocks of 15%, but this difference is not statistically significant.

3. Mechanical Effects

Price restrictions have the mechanical effect of forcing short sellers to be liquidity suppliers instead of liquidity demanders because short sales can rarely be executed against the bid price. Therefore, we expect the removal of price restrictions to be associated with changes in quoting and trading purely because of the mechanics of the rules. In particular, Table 2 shows

[51] Long and short-term options are identified using the Options Clearing Corporation directory as of October 31, 2005.

[52] A regression model that controlled for changes in volatility in the pre- and post-periods provided results that were consistent with those in Table 4.

that about 46% of trades occur on downticks when the tick test applies. We expect that the removal of the tick test will lead to more balanced trading around 50% downticks because short sales can now execute on downticks. This effect should be more obvious in Listed Stocks than Nasdaq NM Stocks where the trades occur on downticks half the time even with the bid test.

A second potential mechanical effect is the percentage of time during the day when the most recent bid change was downward. Table 2 shows that this figure is around 39% when the tick test applies and 47% when the bid test applies. Removing either price restriction could increase the percentage of the day with down bids because short sales can more easily hit the bid to force more downbids. Conversely, if the different price restrictions can explain some of the divergence in these figures, we expect the percentage of downbids in Listed Stocks and Nasdaq NM Stocks to converge.

Table 5 shows how the tick and bid tests affect trading and quoting mechanics. The downtick rows in Panel A show that the percentage of trades on downticks increases from 46% to almost 50% in pilot Listed Stocks. Conversely, the percentage of trades on downticks in control Listed Stocks goes down. On net, the percentage of trades on downticks is fairly balanced when the tick test does not apply and is skewed toward upticks when the tick test does apply. Nasdaq NM Stocks appear to have much more balanced trading even with the bid test so that removing the bid test results smaller increase in the number of downticks. Panel B confirms the result that the tick test has a much larger effect on trading mechanics than the bid test.

The downbid rows in Table 5 measure the percentage of the trading day during which the most recent bid change was downward. Pilot Listed Stocks experience a small increase in the prevalence of downbids but this increase is roughly similar to an increase experienced by control Listed Stocks. The results show a decline in the prevalence of downbids for pilot Nasdaq NM

Stocks, suggesting that short selling under the bid test might shorten the duration of upbids, reflecting the restriction that short sales can only hit upbids.

B. Market Quality

1. Liquidity Measures

Because price restrictions alter how orders transact with each other, they have the potential to alter traditional measures of liquidity. In particular, the price restrictions will often keep a short sale from executing against the bid quote. Therefore, we expect the depth at the bid quote to be lower without price restrictions. If a short sale can not execute against the bid, it often adds depth to the ask quote, and hence, the depth of the ask might be lower without price restrictions. Alternatively, a restricted short sale might set a lower ask price and an unrestricted short sale might exhaust the depth at the bid resulting in a lower bid price. Either way, short sale price restrictions can result in a narrower quoted bid-ask spread.

While quoted spreads and depths measure the displayed supply of liquidity, the effective spread measures liquidity actually available to investors. Therefore, an examination of effective spreads is necessary to understand the effect of price restrictions on liquidity. Because price restrictions can affect the displayed liquidity, we might also expect them to affect the actual liquidity as well.

Table 6 shows results on the effect of price restrictions on liquidity. For the pilot sample, the ask depth decreases for Listed Stocks but increases for Nasdaq NM Stocks. The control sample experiences an increase in depth at the ask. Comparing the changes reveals that the ask depth of the pilot stocks decreased relative to the ask depth for the control stocks in both Listed and Nasdaq NM Stocks. This change is significant for Listed Stocks in both the univariate and

regression-based tests, but is significant for Nasdaq NM Stocks only in the regression-based tests in Panel B. Panel B also shows that the ask depth is augmented about three round lots more when a tick test applies than when a bid test applies.

The bid depth results in Table 6 are slightly different than the ask depth results. The bid depth increases for all sub-samples, but the difference between the pilot and control samples is not significant in Panel A, while Panel B suggests that the bid depth of the pilot stocks does not increase as much as the bid depth of the control stocks. This effect is larger for Nasdaq NM Stocks than for Listed Stocks, therefore, the bid test seems to augment the bid depth more than the tick test does by about one round lot.

We examine two measures of quoted spread. The first, known as the "absolute spread," is simply the difference between the ask price and the bid price, measured in pennies. The second, called the "relative spread," is the absolute spread divided by the bid-ask midpoint, thus measuring the displayed cost to trade as a percentage of the stock's value. Panel A shows that the quoted spreads did not change much when the pilot started for either the pilot stocks or the control stocks. Only the relative quoted spread in control stocks saw an increase but that increase was not statistically different from the change in relative spreads experienced by the pilot stocks. The conclusions from Panel B give a more mixed picture. Quoted spreads decline about 0.3 cents more for pilot stocks, a result that is the same for Listed Stocks and Nasdaq NM Stocks. This result suggests that the tick and bid tests appear to reduce liquidity. However, the results on relative quoted spreads yield the opposite conclusion. While these results are statistically significant, the point estimates are fairly small. The quoted spreads decline by less than half a penny and the relative quoted spread increases by less than a basis point. Taken

together, these results suggest that the tick and bid tests have a slight effect on quoted spreads, if any.

In addition to quoted spreads we also examine effective spreads, estimated for each trade by computing the absolute value of the difference between execution price and the current bid-ask quote midpoint. As we did for the quoted spread, we estimate both absolute and relative effective spreads. The effective spread results in Panel A of Table 6 look quite similar to the quoted spread results. Only one of the changes is statistically significant, a decline in the effective spread of pilot Nasdaq NM Stocks. This result alone would suggest that the application of the bid test decreases liquidity. However, this conclusion is weakened by the lack of statistical significance in the other sub-samples and the lack of a difference between the pilot and control stocks. The Panel B results suggest that the tick test has no impact on effective spreads, but the results on the bid test are mixed. The bid test appears to decrease effective spreads and increase relative effective spreads. Like the results on quoted spreads, the magnitudes of these changes are small.

Overall, the Regulation SHO Pilot shows us that the price restrictions appear to augment depth at both the ask price and the bid price, but price restrictions have little if any effect on realized liquidity. These results are fairly consistent whether the price restriction is structured as a tick test or as a bid test, although the tick test augments the ask depth more and the bid test augments the bid depth more.

2. Return Volatility

The next set of tests examine whether removing the price restrictions alters return volatility. Table 7 displays test results for several volatility measures and several return horizons

to capture different aspects of volatility. The daily price range measures the degree to which prices fluctuate within a day by comparing the high price to the low price in a day. The daily price range declines from the Pre-Pilot Period to the Pilot Period for each subsample. This decline is statistically significant for both Listed and Nasdaq control samples and for the Nasdaq pilot sample, but not for the Listed pilot sample. Panel A suggests that the decline was statistically similar for pilot and control stocks, while the Panel B regression suggests that the daily price range increased for pilot stocks relative to control stocks for both the Listed and Nasdaq samples. Taken together, the daily price range results are mixed on whether the tick and bid tests dampen volatility.

To explore intraday volatility further, we examine our next two volatility measures, absolute returns and return variance, over three time horizons, 5 minutes, 30 minutes, and one day.[53] These measures would increase for pilot stocks over the shorter horizons if the tick and bid tests dampen transitory volatility. The measures would increase for the pilot stocks over the longer horizons if the tick and bid tests dampen permanent volatility. Economically, transitory volatility captures the efficiency of the trading mechanism while permanent volatility captures the effects on equilibrium prices. We separately analyze absolute returns and return variance because each measures volatility slightly differently. Return variance has a tendency to put more weight on larger price movements than absolute returns.

The average absolute returns are lower during the Pilot Period for the control sample across all three return horizons. The univariate results in Panel A show that the pilot stocks experienced a statistically similar decline in the absolute returns as the control stocks for the 30 minute and daily horizons. At the five-minute horizon, however, the pilot sample experienced an

[53] The 5 and 30 minute absolute returns and variances are estimated without including the first half hour of the trading day, after hours trading, or pre-open trading.

increase in absolute returns relative to the control stocks for both Listed and Nasdaq NM Stocks. The regression results in Panel B confirm this finding and show that the effect is larger for Listed Stocks. Panel B also confirms the results for the daily horizon but indicates that absolute returns increased over the 30-minute horizon for pilot stocks relative to control stocks. While the 30-minute results are mixed, the absolute return results suggest that the tick and bid tests have no effect on the magnitude of daily returns while they seem to dampen the magnitude of five minute returns. Further, the tick test seems to dampen short-term returns more than the bid test.

The return variance results in Panels A and B are quite a bit weaker. Panel A shows that the changes to return variances experienced by pilot stocks are statistically similar to the changes in return variances experienced by control stocks for both Listed Stocks and Nasdaq NM Stocks, and this result holds for all three return horizons. Panel B confirms this result for the 30 minute and daily return horizons but finds that pilot Listed Stocks seem to experience an increase in return volatility over the 5 minute horizon relative to control Listed Stocks. In summary, the bid test seems to have no effect on return variance over any time horizon while the tick test might dampen return variance over the five minute horizon.

Because the results above suggest that price restrictions may dampen transitory volatility, we next focus on variance ratios that are specifically designed to capture transitory volatility by comparing the short horizon volatility to longer horizon volatility. If no transitory volatility exists, variance ratios are designed to equal one. We examine three different variance ratios. We compare five minute variance to thirty minute variance, five minute variance to daily variance, and thirty minute variance to daily variance. Panels A and B show that the variance ratio of five to thirty minute returns increased for pilot Listed Stocks relative to control Listed Stocks. Further, Panel B shows that the change for Listed Stocks differs significantly from that

of Nasdaq NM Stocks. However, none of the other variance ratios changed significantly. Because the variance ratios relative to the daily level did not show any changes, the results on transitory volatility are somewhat weak. However, the result for Listed Stocks over the five minute horizon to thirty minute horizon still helps solidify the conclusion that the tick test dampens transitory volatility over the five-minute horizon but seems to have no effect on permanent volatility.

C. *Effect on Stock Prices*

As outlined in section III above, numerous theoretical models suggest that short selling constraints can affect equilibrium stock prices. Some of these models predict that stocks are likely to be more overpriced when short selling constraints are more binding, and when investors disagree more about the stock's true value.

Our evidence above suggests that price restrictions do constrain short selling somewhat. Thus, we are interested in testing the hypothesis suggested by these theories, that removing price restrictions will lessen overpricing. This hypothesis is not likely to hold unless the price restrictions are significant relative to other short selling constraints and our sample stocks are overpriced prior to the start of the pilot. Therefore, rejecting the hypothesis might mean that price restrictions are minor relative to other short selling constraints or that our sample stocks were not overpriced.

Table 8 reports average daily returns and average cumulative returns for pilot and control stocks in the period surrounding the beginning of the pilot. If pilot stocks are over-valued because of the price restrictions, these returns should be significantly negative for pilot stocks relative to the control stocks. Cumulative returns are normalized to zero on April 29, the trading

day prior to the start of the pilot. As indicated in Panel A of Table 8, we observe for Listed Stocks a statistically significant difference between the average returns of control and pilot stocks on May 2, the first day of the pilot. The average control stock experienced a return that exceeded the average pilot stock by about twenty-four basis points. However, we do not observe significant differences in returns on other days after the start of the pilot, nor are the cumulative returns statistically distinguishable at horizons beyond the first day. For Nasdaq NM Stocks, we observe no differences in daily or cumulative returns at or after the start of the pilot that are statistically significant at the five percent confidence level.[54] Because the Listed difference does not persist and because of a lack of a difference in Nasdaq NM Stocks, neither the tick nor the bid test appear to cause stocks to be over-valued.

Figure 1 displays the returns for the pilot and control samples over the first six months of the pilot. The figure gives the raw returns as well as the market adjusted returns. Returns in general appear to be positive over this period but are close to zero when subtracting the market return. Further, the pilot sample appears to under-perform the control sample, especially for Listed Stocks. Table 9 confirms that the six month returns of the pilot stocks appears lower than that of the control stocks. However, this result is not statistically significant. Therefore, the six month returns for the pilot sample are statistically similar to the six month returns for the control sample.

Table 9 also shows that the average alphas are negative but very close to zero. This means that when controlling for risk, the returns of the sample stock are about the same as the returns of the market portfolio. Further, the univariate results of Panel A and the regression

[54] On the Nasdaq NM side, we do observe a statistically significant difference on a single day several days prior to the start of the pilot (April 26). In Table 8, we tested for statistical significance on 21 separate days in two different markets, for a total of 42 different hypothesis tests. Under the hypothesis that the pilot has no effect, we would expect random errors to cause roughly two out of the 42 tests to show false positive significance at the five percent level.

results of Panel B show that the alphas of the pilot sample are statistically similar to the alphas of the control sample. Therefore, the pilot stocks did not underperform the control stocks. This suggests that the removal of the price restrictions will not result in either a long horizon correction of over-pricing nor is it likely to lead to prices being driven below their equilibrium value.

Table 9 also shows the tendency of the alphas to be significantly positive or significantly negative. An alpha is deemed to be negative if the estimate is significantly negative at the 5% level in a two-tailed test. Similarly, an alpha is considered to be positive if the estimate is significantly positive at the 5% level in a two-tailed test. If the alphas are completely random, we would expect to find 2.5% of them positive and 2.5% of them negative. Table 9 shows that the frequency of positive alphas is less than 2.5% while the frequency of negative alphas is slightly higher.[55] The frequency of negative alphas is statistically similar for pilot stocks and control stocks, providing further evidence against prices being driven below their equilibrium level. Among Listed Stocks, the control stocks appear to be more likely to have positive alphas, potentially because price restrictions facilitate over-pricing. This finding however, is weakened by the observation that fewer than 2.5% of control stocks have significantly positive alphas.

D. Market Manipulation

The type of analysis conducted in this study cannot directly prove whether market participants are engaging in manipulative practices, because it is inherently difficult to measure whether the Pilot has had any impact on the degree to which markets are susceptible to

[55] We also estimated the alphas using the value-weighted index. About 2.5% or fewer alphas were significantly positive and about 2.5% or fewer were significantly negative.

SEC_OEA_FCIC_001592

manipulation. Our approach is to identify certain data patterns that we would expect to be more prevalent in a world where prices are manipulated, and investigate to see if these price patterns are more common for pilot stocks than control stocks. Such a pattern does not necessarily mean that manipulation has occurred, but indicates that we might have cause for further analysis.

As argued above in section I-B, if price restrictions inhibit manipulation by short sellers and/or facilitate upward manipulation, we might expect to see more large, sudden price declines in pilot stocks than control stocks. Further, we might expect fewer large, sudden price increases in pilot stocks than control stocks. Either effect should be reflected in the form of decreased skewness in the short-term returns distribution.

Table 10 reports results of statistical tests based on 5-minute, 30-minute, and 1-day returns. For each returns horizon, we follow the same approach as before and test for changes in skewness between the Pre-Pilot Period and Pilot Period, separately for pilot and control stocks, and for Listed and Nadaq stocks, and then test whether the difference of differences is significantly different from zero.

As the table indicates, we find no significant changes between the Pre-Pilot Period and Pilot Period, with the single exception that there appears to have been a marginally significant increase in the skewness of Nasdaq NM control stocks at the 30-minute return interval. However, neither in this nor any other case do we find any statistically significant differences between pilot and control stocks. Thus, we find no evidence that the pilot program has had any impact on returns skewness. The 5-minute and 30-minute results reported in Table 10 are based on the skewness of returns computed using quote midpoints.[56]

[56] We also performed the test using returns computed using trades (results not reported) and again found no significant differences between pilot and control stocks.

Our second approach to testing whether eliminating price restrictions may lead to an increase in price patterns indicative of market manipulation involving short sales is to examine the relative frequency of large negative and positive price reversals, as explained in section V-C, above. Our results are presented in Table 11. Panel A reports results for return reversals occurring over subsequent 5-minute intervals, and Panel B reports results based on 30-minute intervals.

In this table, the line corresponding to "Reversal Size > 2" reports the number of times (per 100,000 observations) that a stock price move of 2 standard deviations or more was reversed in the subsequent period. So, for example, the number 338.4 in the first column of Panel A indicates that for Listed, pilot stocks, the frequency of negative five-minute reversals greater than two standard deviations in magnitude is approximately 0.003384, or 338.4 out of 100,000. In this table, statistical significance is ascertained using a nonparametric bootstrapping procedure outlined in section V-C. This test indicates whether the observed frequency of reversals would constitute a rare event under the null hypothesis that the distribution of reversals is the same for control and pilot stocks. Results are reported for thresholds ranging from two to nine standard deviations.

Our results in Panel A indicate that the pilot stocks tend to experience significantly more 5-minute return reversals than the control stocks, at least for thresholds in the range of two to four standard deviations. This same result is observed for Listed Stocks and Nasdaq NM Stocks. If price restrictions deter price patterns consistent with downward manipulations but not upward manipulations, we might expect to see more negative price reversals in the pilot sample than the control sample, but no difference in positive reversals. In our sample, however, the effect of the

pilot appears to be equally as strong, if not stronger, for positive reversals than for negative reversals.

The results based on the 30-minute horizon, reported in Panel B, tell a different story. At the 30-minute horizon, there is no longer any statistical evidence that pilot stocks have a higher frequency of reversals than control stocks.[57]

As explained in Section V-D, above, our third approach to investigating whether removing price restrictions increases the prevalence of price patterns consistent with market manipulation is to use an autoregression model to estimate the extent to which positive and negative returns tend to be reversed in subsequent periods. The results of this analysis are presented in Table 12.

Panel A shows how five minute returns are correlated with the returns of each of five previous five-minute periods. A positive number reflects returns in the same direction. A negative number reflects return reversals. Most of the coefficients in Table 12 are negative, reflecting a tendency for five-minute price changes to be reversed over subsequent periods. While many of the autocorrelations changed from the Pre-Pilot to Pilot Period, we focus on how the pilot sample compares to the control sample. Over one lag, removing price restrictions makes returns in Listed Stocks more negatively autocorrelated. This is true whether the previous returns were positive or negative. The effect continues for two lags (ten minutes), but only following positive returns. Price restrictions have no effect on five-minute return autocorrelation in Nasdaq NM Stocks.

[57] Panel B of Table 11 reports results for 32 different hypothesis tests (eight different thresholds, positive and negative reversals, Listed and Nadaq samples). Of these 32 tests, only one indicates statistical significance at the five percent level (negative reversals for Listed Stocks at the 3-standard deviation threshold). Even under the null hypothesis of no true effect, we would expect any individual test to show a "false positive" at the 5% significance level approximately 5% of the time. Thus, one significant test statistic out of 32 tests does not constitute a meaningful rejection of the null hypothesis.

Panel B shows the results for thirty minute returns. Measured relative to control stocks, the pilot stocks experience no statistically significant increase in return correlation for any of the thirty minute intervals examined.

In summary, returns in Listed Stocks are negatively serially correlated following both positive and negative returns over short horizons and removing price restrictions increases this negative correlation. The symmetry of these results is consistent with the volatility results above. We find no statistically significant impact for Nasdaq NM Stocks.

E. Small and Low-Volume Stocks

The analysis presented heretofore analyzes Listed Stocks and Nasdaq NM Stocks separately, but beyond this does not make any effort to ascertain whether the pilot may have a disproportionate or qualitatively different effect on smaller or less liquid stocks. In order to address these questions, we partition the sample into deciles according to market capitalization and turnover. As described above in section V-E, we partition the sample into deciles before separating them across markets, to ensure that Listed Stocks and Nasdaq NM Stocks in the same decile are comparable. The sample sizes resulting from these decile partitions are reported in Table 13. As the table indicates, the Listed Stocks are more concentrated in the higher deciles of market capitalization, while the opposite is true for Nasdaq NM Stocks. However, both Listed and Nasdaq NM Stocks have representation across all deciles of the two measures.

Tables 14 through 26 present our results analyzing how many of the results presented earlier vary as a function of size and liquidity. As explained in section V-E, above, these tables are based on a regression analysis where each model includes a pilot indicator and a pilot indicator interacted with indicator variables for deciles one through nine. In this model, the

SEC_OEA_FCIC_001596

marginal effect of the pilot is captured through two channels, first through the pilot indicator variable, and secondly through the interacted indicator variable. To facilitate interpretation, the tables report the sum of the coefficients on the pilot dummy and the interacted terms. This way, the entries in the table show directly how the pilot sample differs from the control sample within each decile.

Table 14 shows how the tick and bid tests affect short selling volume for stocks in each size and turnover decile. Removing the rules increases short selling volume in almost every size and volume decile. Further, the tick test appears to hinder short selling slightly more in small stocks than in large stocks. The bid test, on the other hand, appears to hinder short selling slightly more in large stocks than in small stocks. The affect of the tick and bid tests appear unrelated to turnover level. According to the Nasdaq market share results in Table 15, the removal of the bid test on Nasdaq seems to increase Nasdaq's market share more for small stocks than for large stocks. Overall, the tick and bid tests do seem to have differing affects on short selling for stocks of varying sizes.

In results not reported in tables, only the tick test has a differential effect on the balance of trading in stocks of differing sizes while all other mechanical effects are similar across size and activity levels. The tick test has a bigger effect on the symmetry of trading in smaller stocks but a constant effect on the symmetry of trading in stocks of varying activity levels.

Tables 16 and 17 show whether the augmentation of the bid and ask depth is similar for large and small stocks. These patterns are qualitatively similar in both tables. The tick test augments depth across almost all size and activity levels without clearly augmenting large or small stocks more. The bid test's influence on depth, however, varies widely across size and

activity levels without a discernable pattern. Therefore, the depth augmentation from the tick and bid tests appears unrelated to the size or activity level of the stocks.

As stated above, the increase in the depth at the inside quote affects the displayed supply of liquidity but might not influence realized liquidity, as measured by effective spreads. Table 18 shows that the tick test has no effect on effective spreads for almost all size and activity levels. The bid test, however, seems to result in lower effective spreads for large or more active stocks and potentially higher spreads for small or less active stocks. When significant, however, the magnitudes are still only a few basis points.

The results above show that transitory volatility is dampened by the tick test with much weaker evidence on the bid test. Table 19 shows that the tick test primarily dampens the volatility of small stocks but seems to amplify the volatility of large stocks. The bid test shows a similar pattern but to a lesser degree. The results across turnover levels are not as striking. The tick test seems to dampen volatility for most activity levels and the bid test shows similar yet substantially weaker evidence.

Table 20 summarizes the evidence on how the tick and bid tests affect longer-term variance. While the tick test does not affect the daily return variance in stocks as a whole, it does seem to dampen daily return variance in small stocks and increase daily return variance in large stocks. The bid test shows a similar pattern but the effect is only significant for a few of the smaller size levels. The tick and bid tests have no effect on daily return variance for any activity level.

The results above show little evidence that the tick or bid tests affect price levels. However, there is a 24 basis point return difference between pilot and control Listed Stocks on the first day of the Pilot. Table 21 summarizes whether this return difference varies by size or

activity level. The evidence shows that for most size and activity levels, the pilot and control stocks experienced a statistically similar return on the first day of the Pilot. The Listed pilot stocks had a lower return than the control stocks in the largest size group while the Nasdaq NM pilot stocks had a lower return than the control stocks in the highest turnover group. Hence, the prior results seem to be driven by the large Listed Stocks.

Table 22 compares the pilot stock six-month alphas to the control stock six-month alphas for the various size and activity groups. Like the May 2 results, the pilot alphas are statistically similar to the control alphas in every size and activity level. Therefore, the tick and bid tests do not promote or hinder pricing efficiency for any size or activity level.

Recall from Table 11 that negative and positive five-minute price reversals are more prevalent in the pilot sample than the control sample, especially for Listed Stocks. Repeating our analysis across deciles, we find the difference between pilot and control Listed Stocks is significantly more pronounced for stocks with the lowest market capitalization (results not presented). These findings are consistent with our other results indicating that smaller stocks tend to be more volatile when the tick test is removed. However, for the smallest Listed Stocks, we observe a greater number of positive than negative price spikes, suggesting that removing the tick test does not make smaller stocks unduly susceptible to negative price pressure.

VII Summary and Conclusions

The pilot program established by Regulation SHO exempted approximately one third of the Russell 3000 stocks from the "tick test" (Rule 10a-1) for Listed Stocks and the "bid test" (former NASD Rule 3350) for Nasdaq NM Stocks traded on Nasdaq or traded OTC and reported to an NASD facility. The pilot was designed to facilitate comparison between the pilot stocks

and control stocks, thus creating an unprecedented opportunity to observe in a controlled environment the effects of removing the price restrictions.

This study has compared pilot and control stocks along numerous dimensions, in an effort to capture a broad range of possible effects. Our main empirical results are as follows:

- The pilot is associated with increased short selling volume in Listed and Nasdaq NM Stocks, but appears to have no impact on the level of short interest in either market. The increase in short selling is slightly higher for small Listed Stocks than for large Listed Stocks.

- The pilot is associated with an increase in Nasdaq's share of trading volume in Nasdaq NM Stocks, suggesting that market participants are routing trades to other venues in order to avoid the bid test. The market share increases more for smaller stocks. For the largest Nasdaq NM Stocks, such as those included in the Nasdaq 100, there is no significant difference in market share.

- We find no evidence that the pilot has had any impact on the level of trading activity in the options market, as we would have expected to see if market participants are using option markets to avoid the tick test or the bid test.

- For Listed Stocks, less than 46% of all trades are executed on down bids when the tick test applies, while the number is close to 50% for pilot stocks, suggesting that Rule 10a-1 constrains the execution price in four to five percent of trades. For Nasdaq NM Stocks, Rule 3350 does not explicitly prevent trading on downticks, but our results show that it effectively constrains trading on downticks for about one half of one percent of trades.

- The pilot is associated with a decrease in quote depth, especially on the ask side for Listed Stocks—our evidence confirms that Rule 10a-1 forces some short sellers who would otherwise be liquidity demanders to act as liquidity suppliers. The decrease in depth appears unassociated with size or turnover.

- Other than the effect on market depth, the pilot has had no clear effect on market liquidity—most of our tests indicate that liquidity was not significantly impacted by the pilot, but some tests indicate small increases or decreases in liquidity, depending on the measure.

- The pilot is associated with an increase in some measures of intraday volatility. These increases appear to be confined to the smaller stocks as larger stocks experienced a decline in volatility during the pilot.

- On average across all types of stocks, the pilot does not appear to have any significant effect on daily volatility—however, our results indicate the pilot is associated with

lower volatility for stocks with higher market capitalization, and higher volatility for stocks with lower market capitalization.

- Based on the price reaction to the initiation of the pilot, we find limited evidence that the tick test distorts stock prices—on the day the pilot went into effect, Listed Stocks in the pilot sample underperformed Listed Stocks in the control sample by approximately 24 basis points. However, the pilot and control stocks had similar returns over the first six months of the pilot.

- We find no evidence of "bear raids" associated with the pilot. More specifically, we test for evidence of bear raids in three ways:

    - We test whether the pilot has affected the relative frequency of large negative vs. large positive stock returns, as reflected in the skewness of the returns distribution. There is no difference in skewness between control and pilot stocks
    - A bear raid may be associated with a large negative return that is very quickly reversed, or a "negative price spike." Although we do find a higher incidence of negative price spikes in the pilot sample at some horizons, the same thing is observed for positive price spikes.
    - We also measure directly the tendency for price movements to be reversed in subsequent periods. Again, we find that the pilot is associated with a slightly greater tendency for price changes to be reversed, but this effect is observed equally for positive and negative returns.

In summary, having examined the impact of the Regulation SHO Pilot on a wide array of market characteristics, we conclude that price restrictions constitute an economically relevant constraint on short selling. Our evidence suggests that removing price restrictions for the pilot stocks has had an effect on the mechanics of short selling, order routing decisions, displayed depth, and intraday volatility, but on balance has not had a deleterious impact on market quality or liquidity. In various dimensions, our evidence confirms that the tick test of Rule 10a-1 acts as a more binding constraint than the bid test of former NASD Rule 3350. On most dimensions, the effects of the pilot do not appear to be systematically related to market capitalization or trading volume, suggesting that our results give a reasonable picture of what we might expect to see if price restrictions were removed for all stocks, including smaller stocks and stocks less actively

traded than those in the Russell 3000. However, some results, particularly those involving volatility, suggest that the effect of the tick test and the bid test may be systematically related to market capitalization.

We conclude with a few caveats. While the Pilot study was designed to facilitate a natural experiment in a controlled environment, the results might not be entirely representative of removing the rule permanently for all stocks. It is possible that traders might behave differently if a rule were permanently and completely removed than if it is only temporarily or incompletely removed. Moreover, it is possible that traders with manipulative intentions might be on good behavior if they believe that heightened scrutiny during the Pilot increases their chances of getting caught.

Tables

Table 1: Sample characteristics

This table shows the number of sample stocks categorized by whether they are in the Pilot, their listing status, and whether they have tradable options on them. The Pilot stocks are those designated in the first Pilot Order that are trading on Amex, Nasdaq NM, or NYSE as of May 2, 2005. The Control stocks are the ones that were eligible to be selected for the Pilot but were not. The Control stocks are limited to those trading on Amex, Nasdaq NM, and NYSE as of May 2, 2005. Listed Stocks are stocks listed on NYSE or Amex. This table shows the sample sizes as of October 31, 2005 as well. To avoid survivor biases, we retain stocks in the sample even if they stocks cease trading on Amex, Nasdaq NM, or NYSE before the end of our sample period on October 31, 2005. This table shows the sample sizes as of October 31, 2005 as well. Stocks are considered optionable if they have traded options at some point in the four months prior to the start of the Pilot. Short-term options are options with experations within one year.,

Variable	Listed Stocks		Nasdaq Stocks	
	Pilot	Control	Pilot	Control
# Stocks (first day of the Pilot)	504	973	439	917
# Stocks (last day of the Sample Period)	496	949	423	877
# Optionable Stocks (all options)	350	690	278	573
	(69.44%)	(70.77%)	(63.33%)	(62.28%)
# Optionable Stocks (short-term options)	350	688	277	567
	(69.44%)	(70.56%)	(63.10%)	(61.63%)

Table 2: Comparison of Pilot and Control Stocks Before Initiation of Pilot

This table compares the Pilot and Control stocks in several statistics over the four month period prior to the start of the Pilot on May 2, 2005. The statistical difference between the samples is tested using a two-sample t-test. * and ** indicates that the Pilot stocks are statistically different from the Control stocks at the 5% and 1% levels in a two-tailed test.

Table 3: Changes in Short Selling Activity

This table summarizes how short selling changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" and the six months following the start date are called the "Pilot". The table shows the average change in short selling for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Short Volume is the number of shares in short sale transactions divided by total share volume. Short Trades is the number of short sale transactions divided by total transactions. Short Interest is the monthly short interest times 100 divided by the shares outstanding. Days to Cover is the monthly short interest divided by the average daily share volume during the corresponding month. Nasdaq market share is Nasdaq's share of the volume of short selling. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the Difference in the Change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 4: Changes in Option Trading

This table summarizes how option trading and open interest changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" and the six months following the start date are called the "Pilot". The table shows the average change in option trading and open interest for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Panel A reports statistics on all options. Panel B reports statistics on short-term options. The data includes securities that had put and call option volume in both the Pre-Pilot and Pilot periods. There were a total of 690 Control stocks and 350 Pilot stocks included in the Listed sample and 573 Control stocks and 278 Pilot stocks in the Nasdaq sample. Open interest and volume are adjusted for stock splits. New option listings after May 1, 2005 were excluded from the analysis. The data source for the options data is the Options Price Reporting Authority (OPRA). Short-term options are identified using the Options Clearing Corporation directory. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We also test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using two sample t-tests. [a, b] indicates that the difference for Nasdaq NM Stocks is statistically different from the difference for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 5: Changes in Trading and Quoting Mechanics

This table summarizes how trading and quoting mechanics change when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" Period. The table shows the average change in the number of down ticks and the percent of time on a down bid for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 6: Liquidity Measures

This table summarizes how liquidity changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-period" and the six months following the start date are called the "Pilot Period". The table shows the average change in various liquidity measures for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the Difference in the Change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 7: Volatility

This table summarizes how volatility changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The table shows the average change in various volatility measures for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Daily Price Range is 100*(log high – log low). Absolute return and standard deviation are reported in percentage points. While standard deviation is reported, tests were run on variances to avoid Jensen's inequality. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for pilot securities and the variable's Pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 8: Returns around the May 2, 2005 Start of the Pilot

This table shows the returns surrounding the May 2 initiation of the pilot. The raw returns are equally-weighted averages of the returns for each stocks, as collected from CRSP. The Cumulative Returns are set to be zero on the day prior to the start of the pilot. The Cumulative returns represent the compounded returns on an investment made at the April 29 closing price. * indicates that the control stock returns are statistically different from the pilot stock returns at the 5% significance level in a two-tailed test. None of the returns are statistically different at the 1% level.

Table 9: Six Month Returns

The table summarizes tests of whether the six month returns of the pilot stocks differ from the six month returns of the control stocks. The raw returns are compounded cumulative returns from CRSP. If a stock is not in the sample for the entire six months, its return from its last day is compounded to six months. The market adjusted returns is simply the raw return minus the CRSP equally-weighted index. The alpha is estimated in-sample by regressing the raw return for a stock on the equally-weighted CRSP index return. A stock's alpha is considered "negative" if it is statistically below zero at the 5% level in a two-tailed test. Likewise, a stock's alpha is considered "positive" if it is statistically above zero at the 5% level in a two-tailed test. ** indicates that the control stock returns are statistically different from the pilot stock returns at the 5% significance level in a two-tailed test.

Panel A: Univariate Differences

Variable	Market	Pilot	Control	Difference

Alpha	Listed	-0.0001	0.009
Alpha	Nasdaq	-0.0001	0.005

Table 10: Skewness

This table summarizes how skewness changes when the tick and bid tests are removed. The four months prior to the pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The table shows the average levels and changes in various skewness measures for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Sample skewness is computed for each stock in the pilot and contol sample in the Pre-Pilot and Pilot period, for five-minute, thirty-minute, and one day return intervals. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1% and 5% level in a two-tailed test.

		Pilot Sample			Control Sample			Pilot Δ minus
Variable	Market	Pre-Pilot	Pilot	Δ	Pre-Pilot	Pilot	Δ	Control Δ

Table 11: Extreme Price Reversals

This table summarizes how the frequency of large negative and positive short-horizon price reversals differs across pilot and control stocks. The numbers in the table represent the number of reversals per 100,000 stock/intervals. A negative (positive) reversal is defined as a negative (positive) return immediately followed by a positive (negative) return. The "size" of the reversal is defined as the minimum absolute value of the two adjacent returns, normalized by the pre-pilot standard deviation of the stock's holding-period return, where the second return is computed as a percentage of the lagged price, and the holding period is five minutes or thirty minutes. The frequency of reversals is computed based on a six-month period following the pilot start date (May 2, 2005). The pre-pilot standard deviation used to normalize the returns is computed over a four-month period prior to the start date. Nonparametric statistical tests based on a bootstrapping procedure determine whether the number of reversals observed in the pilot sample would be statistically rare in the control sample. **, * indicates statistical significance at the 1% and 5% level in a two-tailed test.

Table 12: Semi-Autoregression Results

This table reports average regression coefficients of returns on lagged positive and negative component returns, for pilot and control stocks before and after the start of the pilot. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The coefficients reported in the table are the mean coefficients across all stocks in the subsample, estimated over the designated period, of the autoregressive model:

$$R_t = \sum_{n=1}^{5} \alpha_n R_{t-n}^{-} + \sum_{n=1}^{5} \beta_n R_{t-n}^{+} .$$

where R_t represents the stock return in period t, and

$$R_t^{-} = \min(0, R_t) \qquad R_t^{+} = \max(0, R_t) .$$

Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test.

Table 13: Sample Deciles

This table shows the number of stocks in each market capitalization, turnover, and short selling decile. The deciles are set so that each decile contains the same number of stocks for the full sample. This table reports the subsample sizes separately for pilot and control stocks and for Listed and Nasdaq NM Stocks. It also gives the proportion of stocks in that decile and market that are pilot or control stocks.

	Listed				Nasdaq			
	Pilot		Control		Pilot		Control	
	Count	Proportion	Count	Proportion	Count	Proportion	Count	Proportion
Decile	Market Capitalization							
Lowest	22	33.9	43	66.1	62	28.4	156	71.6

Table 14: Changes in Short Selling Activity Across Market Cap and Turnover Deciles

This table shows the marginal effect of the pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Short Selling Volume}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Short Selling Volume}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the number of shares sold short on a day divided by the total volume on that day. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

	Market Capitalization		Turnover

Table 15: Changes in Nasdaq Market Share Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Nasdaq Market Share}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Nasdaq Market Share}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the Nasdaq share of short selling volume on a day. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. ** indicates that the effect is statistically different from zero at the 1 % level in a two-tailed test.

Table 16: Changes in Ask Depth Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Ask Depth}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Ask Depth}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the ask depth. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

Table 19: Changes in Five-Minute Return Variances across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Variance (5 minute returns)}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i + \beta_{11} \text{Pre Variance(5 minute returns)}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$ multiplied by 10^6. The dependent variable is the five-minute return variance. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

Table 21: May 2 Market Adjusted Returns Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$R_{May2i} = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the return from the close of trading on April 29, 2005 to the close of trading on May 2, 2005. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. * indicates that the effect is statistically different from zero at the 5% level in a two-tailed test. None of the numbers presented below are significant at the 1% level.

Table 22: Six Month Market Model In-Sample Alphas Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Alpha}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is in-sample alpha estimated for each stock based on the market model. The market model alpha was estimated over the six month period from May 2, 2005 to October 31, 2005 by regressing the daily stock returns on the daily market return, which is represented by the CRSP equally-weighted index returns. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. None of the numbers presented below are significant at the 5% or 1% level.

Appendix A: Concurrent Regulation SHO Pilot Studies

We have identified four concurrent studies that also examine the effect of removing the tick test and/or the bid test during the Regulation SHO Pilot. Much of the analysis is similar to the analysis reported in this report, but the construction of the samples and the focus of the test design differs in important ways. Each approach has its merits. See the attached Table A.1 for a simplified comparison of the approaches.

One main difference between the construction of the samples for this report and the sample construction in the concurrent papers is the incorporation of stocks that might be outliers. This report includes these stocks because they might be the ones most affected by the Pilot. The other studies exclude these stocks in order to improve matching between the pilot and control stocks or to remove the influence of confounding events.

Three academic studies (Alexander and Peterson (2006), Deither, Lee, and Werner (2006), and Wu (2006)) plus the OEA study incorporated a Pre-Pilot period into the study. The design of the Bai (2006) study does not require comparison to a Pre-Pilot period. All studies compared Pilot stocks to Control stocks, but two conducted one-on-one matches (Alexander and Peterson (2006) and Wu (2006)).

Despite the different decisions, many of the results of this report are supported by the results of the concurrent studies. A summary of the results of the three studies most comparable to this report can be found in Table A.2. Bai (2006) is not included because the focus differs from this report. The general results, however, are in line with the results of the academic studies and this report. Specifically, Bai (2006) finds no effect of the pilot on stock price reactions to negative earnings shocks.

Table A.1: Comparison of Sample Construction and Research Focus

Study	Alexander and Peterson (2006)	Bai (2006)	Diether, Lee, and Werner (2006)	Wu (2006)	SEC
Sample Period	4/1/05 to 5/31/05 1 month before 1 month during	5/2/05 to 11/30/05 7 months during	2/1/05 to 7/31/05 minus 4 weeks around May 2 10 weeks before 10 weeks during	1/3/05 – 8/31/05 4 months before 4 months during	1/1/05 to 10/31/05 4 months before 6 months during

Excluded Stocks	Amex stocks Stocks delisted before 5/31	Stocks delisted before 11/30/05 Commercial Banks REITS Earnings announcements with EPS ≥ forecast. Announcement time uncertain or during trading hours. Outliers and stocks with missing information.	Amex and NASDAQ Small Cap stocks Stocks with ticker changes or changes in listing venue during sample period Stocks not in 2005 Russell Stocks w/ prices > $100 Stocks w/ spreads > $1 Stocks delisted before 7/31	Stocks not in 2005 Russell Stocks with prices > $900	Stocks delisted before 5/2 Includes stocks delisted before 10/31
One-on-One Matching	Yes (Keep best 50% of matches)	No	No	Yes (Exclude if no good control match)	No
Final Sample	NYSE: 224 pairs Nasdaq: 183 pairs	945 negative earnings announcements. 311 Pilot, 634 Contorl	NYSE: 448 pilot, 904 control Nasdaq: 376 pilot, 757 control	NYSE: 332 pairs	Listed: 504 pilot, 973 control Nasdaq: 439 pilot, 917 control
Focus of Study	Effect of pilot on short selling, liquidity, volatility, market efficiency, and price impact.	Effect of pilot around Negative Earnings Announcements	Effect of increases in short selling on market quality. Plus, effect of pilot on short selling, liquidity, volatility.	Price discovery of short selling. Plus, effect of pilot on short selling, liquidity, volatility, and efficiency of large/small stocks.	Effect of pilot on short selling, liquidity, volatility, market efficiency, and extreme price changes. Plus, differences across large/small and liquid/illiquid stocks

Table A.2: Comparison of Results

Study	Alexander and Peterson (2006)	Diether, Lee, and Werner (2006)	Wu (2006)	SEC
Short Selling	No significant impact on short sale volume for either NYSE or NASDAQ. NYSE: Pilot stocks had a higher number of short sales trades and a lower average short sale trade size. NASDAQ: No impact on number of short sales trades or average short sale trade size.	Higher relative short sale volume. NYSE: higher number of short sale trades No impact on the number of NASDAQ short sale trades.	Examines only short selling on the NYSE Relative short selling increases for pilot stocks. Significant for small stocks but not large stocks.	Higher short sale volume and a higher number of short sale trades. No impact on short interest or days to cover. No impact on option trading volume or open interest. Trading is more balanced for pilot stocks. The increase in short selling is bigger for small stocks.
Liquidity	NYSE: larger spreads, smaller quoted ask depth, smaller quoted bid depth, higher price impact NASDAQ: larger spreads No effect on effective spreads	No impact on NASDAQ stocks. NYSE: Larger quoted, effective, and realized spreads, smaller quoted ask depth, higher relative bid depth, smaller buy imbalances.	Relative effective and quoted spreads increase with pilot by < 1 bps. This is statistically significant only for small stocks. Smaller buy imbalances across all market cap groups. Offer depth declines for most size groups.	Listed: smaller quoted ask depth in univariate and regression. Regression shows decrease in both bid and ask. Some tests show small increases or decreases in realized liquidity.

Study	Alexander and Peterson (2006)	Diether, Lee, and Werner (2006)	Wu (2006)	SEC
Volatility	No impact. The authors examine six volatility measures: 5 minute return volatility, semi-variance, daily relative price range, Fama-French three-factor model idiosyncratic risk, CAPM idiosyncratic risk, and implied volatility.	No increase in the majority of the 26 different volatility measures for Pilot Stocks. NYSE: higher short term volatility (15/5 variance ratio), daily return volatility, trade to trade return volatility, offer to offer quote volatility, five-minute bid and offer volatility, daily up-side and down-side semi-variance. The authors examine semi-variance, trade returns, bid quote returns, and ask quote returns for various time lengths: trade to trade, quote to quote, five-minute, fifteen-minute, and daily. They also examine the 15/5 minute variance ratio.	Variance ratios did not change with pilot. Daily price range and intraday price standard deviation do not change.	Some evidence of an increase in intraday volatility. This appears to be driven by smaller stocks as larger stocks saw a decline in intraday volatility during the pilot. While average daily volatility does not change, smaller stocks experienced lower volatility during the pilot as larger stocks experienced an increase.
Efficiency	No impact except for the following measures for NYSE stocks: higher autocorrelation of five-minute returns, greater likelihood of a lower price for the second trade after a short sale, and greater likelihood of a higher trade price for the first trade after a short sale. The authors examine the autocorrelation of five- and thirty-minute returns, upside minus downside r-squared, and price runs.		Hasbrouck pricing errors show no significant change with pilot. Intraday return autocorrelations (30 and 60 minute) did not change with pilot.	Higher five-minute return reversals. Higher five-minute semi-autoregression. No impact on thirty-minute return reversals, thirty-minute semi-autocorrelation, or on skewness in five-minute, thirty-minute, and daily returns.

Study	Alexander and Peterson (2006)	Diether, Lee, and Werner (2006)	Wu (2006)	SEC
Returns	No significant impact on returns surrounding the announcement date of the Pilot stocks, on the initiation day of the Pilot, or during the first month of the Pilot.			Listed pilot stocks had a 24 bps lower return than control stocks on the initiation day of the Pilot but had statistically similar cumulative return during the 6 months after the Pilot.
Conclusion	Concerns about the removal of the price tests leading to a degradation of market quality are unfounded. Price tests do not further the stated objectives of short sale regulation.	While the suspension of the NYSE tick test is found to be associated with larger spreads and higher short-term volatility, this evidence is consistent with the distorting effects of the tick test on short sellers (i.e., forcing them to be liquidity suppliers) rather than any benefit to investor welfare.	Tick test reduces short selling and narrows the spread primarily for small stocks. Tick test does not seriously constrain short sellers from trading on their information.	Most evidence shows that the pilot had a minor effect. The most intriguing results are in volatility. Some evidence that the tick test has a bigger effect in small stocks.

Economic Analysis of the Short Sale Price Restrictions Under the Regulation SHO Pilot

Economic Analysis of the Short Sale Price Restrictions under the Regulation SHO Pilot

A Study by the Staff of the Office of Economic Analysis[1]

I Introduction

A. Background

Short selling in exchange-listed stocks ("Listed Stocks") in the U.S. has been subject to a "tick test" since 1938. Rule 10a-1 under the Securities Exchange Act of 1934 allows short sales to occur only at an uptick or a zero uptick (also known as a "zero-plus tick") for Listed Stocks. That is, short sales in Listed Stocks may be effected above the last trade price or at the last trade price if the last trade price is higher than the most recent trade at a different price.[2] Prior to August 1, 2006, Nasdaq was not operating as an exchange and, therefore, its stocks were not Listed for the purposes of Rule 10a-1. However, in 1994, the National Association of Securities Dealers ("NASD") introduced a "bid test" for Nasdaq National Market Stocks ("Nasdaq NM Stocks"), which applies to trading on Nasdaq and trading reported to the NASD. This rule, the former NASD Rule 3350, specifies that whenever the bid is a downtick from the previous bid, traders other than market makers may sell short only at prices one penny above the bid.[3] Within this report, the tick test and bid test will be described more generally as "price restrictions."

---

[1] For further information, questions, or comments, please contact Amy Edwards (edwardsa@sec.gov), Stewart Mayhew (mayhews@sec.gov), Tim McCormick (mccormickt@sec.gov), or Allan Zebedee.

[2] Paragraph (a) of Rule 10a-1 governs short sales of any security registered on, or admitted to unlisted trading privileges on, a national securities exchange if such transactions are made pursuant to an effective transaction reporting plan as defined in Rule 600 of Regulation NMS. Unless a specific exemption applies, short sales are prohibited at a price that is either (1) below the last reported price of a transaction reported pursuant to an effective transaction reporting plan (known as a "minus tick"); or (2) at the last reported price if that price is lower than the last reported different price (known as a "zero-minus tick").

[3] When Nasdaq began operating as a national securities exchange, NASD Rule 3350 was replaced by Nasdaq Rule 3350 for Nasdaq NM stocks traded on Nasdaq, and NASD Rule 5100 for Nasdaq NM stocks traded over-the-counter and reported to a NASD facility. In connection with Nasdaq commencing operations as a national securities exchange the Nasdaq National Market was renamed to the Nasdaq Global Market and Nasdaq NM stocks were renamed Nasdaq Global Market stocks. See NASD Rule 4200(a)(6) (providing that the Nasdaq Global Market is the successor to the Nasdaq National Market); see also Securities Exchange Act Release No. 54071 (June 29, 2006),

In July 2004, the Securities and Exchange Commission (the "Commission" or the "SEC"), adopted Regulation SHO, which contains Rule 202T, allowing the Commission to establish, by separate order, a pilot program to examine the efficacy of price restrictions.[4] At the same time, the Commission issued an order ("Pilot Order") establishing a pilot program ("Pilot") exempting a third of the stocks in the Russell 3000 Index ("Russell 3000") from all price restrictions.[5] The pilot stocks constitute a sample of Russell 3000 stocks that is stratified across average daily trading volume levels within each of three groups, corresponding to New York Stock Exchange ("NYSE,") Nasdaq, and American Stock Exchange ("AMEX") issues.[6] The Pilot went into effect on May 2, 2005, and was scheduled to end on April 28, 2006,[7] but has been extended to August 6, 2007 to allow the Commission to consider potential rulemaking after evaluating the results of the Pilot.[8]

The Pilot was designed to enable the Commission and the broader community to evaluate whether the price restrictions have a substantive impact on market quality, and more generally to achieve a deeper understanding of how price restrictions affect the trading process. In its Pilot Order, the Commission provided further explanation for the Pilot:[9]

> The Pilot will enable us to obtain empirical data to help assess whether short sale regulation should be removed, in part or in whole, for actively-traded securities, or if retained, should be applied to additional securities. The Pilot will allow us to study trading behavior in the absence of a short sale price test on the stocks selected by comparing the trading behavior of the control group stocks to that of

71 FR 38922 (July 10, 2006) (File No. SR-NASD-2006-068). For purposes of this study, we refer to Nasdaq NM stocks as Nasdaq NM or Nasdaq Stocks and not Nasdaq Global Market stocks. Prior to Nasdaq commencing operations as an exchange, Nasdaq securities traded on exchanges on an unlisted trading privileges basis were not subject to any price restriction.

> the Pilot stocks through empirical analysis. We will examine, among other things, the impact of price tests on market quality (including volatility and liquidity), whether any price changes are caused by short selling, costs imposed by a price test, and the use of alternative means to establish short positions.

To the extent that price restrictions have discernable effects, these should appear as differences between the pilot stocks, which the Commission selected to be a representative subsample of the Russell 3000 index, and the rest of the Russell 3000, which serve as control stocks. The results observed from the Pilot will help inform any subsequent rulemaking that the Commission may consider at the conclusion of the Pilot.

B. Overview

The goal of this study is to examine whether eliminating price restrictions has had any impact on market quality, broadly defined. We compute and compare various market statistics for pilot and control stocks both before and during the Pilot. The pilot stocks and control stocks are statistically similar prior to the Pilot. The analysis is conducted separately for both Listed Stocks and for Nasdaq NM Stocks to help distinguish the tick test from the bid test.

We designed this study to evaluate the various policy alternatives outlined in the first Pilot Order.[10] For example, the results of the Pilot might suggest eliminating all price restrictions, extending a uniform test to all securities, or removing price restrictions for a subset of stocks. Any of these alternatives would potentially affect not only the stocks in the Russell 3000, but others that have a lower market capitalization and perhaps are less actively traded than those in the pilot study. Price restrictions may have different effects for larger and smaller market capitalization stocks, or for more actively traded and less actively traded stocks. Accordingly, as part of our comparison of pilot and control stocks, we partition the sample into

[10] See SEC Release No. 34-50104, July 28, 2004.

groups based on market capitalization and turnover (trading volume divided by shares outstanding). The results for the smallest and least actively traded stocks within the Russell 3000 would be the most informative about the likely impact of price restrictions for those stocks that are not in the Russell 3000. Moreover, comparing large and small stocks (or high and low volume stocks) within the Russell 3000 should reveal whether any effects of the price restrictions are related to size or volume.

This study investigates various hypotheses relating to the potential effects of price restrictions. First, if price restrictions represent an economically meaningful constraint on short selling, they may induce some traders to avoid short selling or to reduce the size of their short positions. Thus, we test whether the level of short trading volume and short interest are significantly different for pilot and control stocks.[11] Both for Listed Stocks and Nasdaq NM Stocks, we find that price restrictions reduce the volume of executed short sales relative to total volume, indicating that price restrictions indeed act as a constraint to short selling. However, in neither market do we find significant differences in short interest across pilot and control stocks.

To the extent that price restrictions are applied in some markets and not in others trading the same stocks, traders who find the restrictions binding might avoid the constraint by choosing a venue where the constraint is not applied. Specifically, because not all markets that trade Nasdaq NM Stocks apply the Nasdaq Bid Test, short sellers can route their orders to avoid the rule., Removing the rule eliminates the need to avoid it and therefore might affect where short sales in Nasdaq NM Stocks are executed. Our results indicate that Nasdaq's share of short selling volume is negatively impacted by price restrictions, suggesting that some short sellers are routing orders to avoid price restrictions.

[11] Short interest is the total number of shares of a security that have been sold short and have not yet been repurchased.

Additionally, traders can avoid price restrictions by synthetically shorting in the option market rather than shorting the stock.[12] To measure the extent to which price restrictions drive short sellers to the option market, we compare option market trading activity for pilot and control stocks. We find no evidence that short sale price restrictions in equities have an impact on option trading or open interest.[13]

Regardless of whether price restrictions have any substantive impact on overall market liquidity or inhibit manipulation, they affect the ability of short sellers to demand liquidity by getting prompt execution of market orders. For purely mechanical reasons, we would expect price restrictions to affect the number of trades occurring on downticks vs upticks, and the percentage of time the market is in an upbid or downbid state. For Listed Stocks, we find that the application of the tick test results in significantly fewer than 50% of transactions occurring on downticks or zero downticks, while trading is more balanced when the tick test does not apply. For Nasdaq NM Stocks, we find that the percentage of time the market is in a downbid state declines when the bid test is removed, suggesting that downbids occur more regularly when the bid test applies.

To the extent that price restrictions inhibit the free movement of stock prices, they might make markets less liquid. On the other hand, because short sellers can rarely execute against a bid quotation, price restrictions force short sellers to act more like liquidity suppliers than liquidity demanders. Therefore, removing them might decrease the perceived supply of liquidity. To test whether price restrictions have a more general impact on liquidity or volatility, we compare quoted and effective spreads, intraday volatility, and the daily price range across

[12] A synthetic short position can be achieved by buying a put option and writing a corresponding call option in the same security. The term synthetic refers the fact that you can replicate the payoffs of an equity short sale without actually short selling the equity itself.
[13] Open interest is the total number of options contracts that have not yet been closed or fulfilled by delivery.

pilot and control stocks. We find that quoted depths are augmented by price restrictions but realized liquidity is unaffected. Further, we find some evidence that price restrictions dampen short term within-day return volatility, but when measured on average, they seem to have no effect on daily return volatility.

Finance theory predicts that under certain conditions, constraints on short selling may cause securities to be misvalued by the market, particularly when investors have highly divergent opinions about the stock.[14] A simple argument is that short sale constraints make it more costly for those investors who have a negative opinion of a stock to trade on their beliefs, and thus, their views may be reflected less in the stock price than those who have a positive view. Under more general assumptions, theoretic models predict that short sale constraints can cause stocks to be either overvalued or undervalued.[15] To test whether price restrictions constitute an economically consequential short sale constraint that influences equilibrium stock prices, we investigate whether the prices of pilot stocks react in response to the removal of the rule. We find that for Listed Stocks, control stocks outperform pilot stocks on average by about 24 basis points on the first day of the Pilot, suggesting that the tick test may cause stocks to be slightly overvalued. For Nasdaq NM Stocks, no significant return differential was observed surrounding the initiation of the pilot. We also examine stock returns for a six-month period following the initiation of the pilot program, to ascertain whether the elimination of price restrictions has had any discernible effect on stock prices over a longer horizon. We find that pilot stocks and control stocks have similar returns over this horizon, but some tests show weak evidence consistent with the hypothesis that price restrictions facilitate over-pricing. In the absence of price restrictions, prices do not rise as much as with price restrictions, leading to a lower equilibrium price.

---

[14] See, for example, Lintner (1969), Miller (1977), and Scheinkman and Xiong (2003).
[15] See Gallmeyer and Hollifield (2006).

One view of price restrictions is that they help prevent "bear raids," or that they make it more difficult for would-be manipulators to drive prices down below their true values. On the other hand, price restrictions might also make it more difficult for short sellers to move prices back toward their true value in response to upward manipulations. Because price restrictions are inherently short-term constraints, any substantive impact on the susceptibility of securities to manipulation is most likely to be manifest at short horizons. For this reason, we focus our investigation on price patterns that might indicate manipulative behavior at a daily or intraday frequency. To explore these issues, we proceed along three avenues of investigation.

First, to the extent that price restrictions create an environment less conducive to price patterns that might indicate downward manipulation and more conducive to price patterns that might indicate upward manipulations, we might expect to observe more extreme negative returns, and fewer extreme positive returns, for pilot stocks than for control stocks. To investigate this, we use our control-sample methodology to test whether the skewness of the returns distribution of short-horizon returns differs across pilot and control stocks.[16] Our results indicate no statistically significant impact of the pilot program on return skewness, measured at five-minute, thirty-minute, or one-day return intervals.

Second, we identify positive and negative price "spikes," or instances when extreme price moves are reversed shortly afterwards, and examine whether the frequency of positive and negative spikes differs across pilot and control stocks. We find that at a short (five-minute) horizon, pilot stocks tend to experience more price reversals than control stocks, but that this result is the same for negative and positive price reversals. At a thirty-minute horizon, we find no evidence that there are more price reversals for pilot stocks than control stocks.

[16] Bris, Goetzmann, and Zhu (2004), in a study of the effects of short sale regulations around the world, find evidence suggesting that short selling constraints can affect the skewness of the returns distribution.

Third, we use a time-series regression methodology to measure the extent to which positive and negative price changes are likely to be subsequently reversed. If price rules play an important role in preventing short sellers from temporarily driving prices down below their fair value, we would expect to see a larger portion of negative returns subsequently reversed for the pilot stocks than the control stocks. For Listed Stocks, we find that a larger portion of both negative and positive returns are subsequently reversed for pilot stocks than control stocks at a short (five-minute) horizon. The symmetry of these results is consistent with the increase in volatility discussed above rather than any marked increase in the potential for downward price pressure. On the other hand, a marked increase in the potential for downward price pressure relative to upward price pressure should lead to an asymmetry in positive and negative return reversal results. We do not find this asymmetry. At a thirty-minute horizon, we find no statistically significant difference in the magnitude of return reversals for Listed pilot and control stocks. For Nasdaq NM Stocks, we find no statistically significant difference in the magnitude of return reversals for pilot and control stocks for either five-minute or thirty-minute intervals.

One important element of the Pilot is the ability to examine whether the tick test affects stocks of varying sizes and volume differently. For example, does the tick test affect larger stocks in the same manner as smaller stocks and would the tick test be more effective for large or small stocks? To examine these questions, we divide the stocks into size, measured as market capitalization, and volume, measured as trading volume divided by shares outstanding (turnover), groups and run each of our tests again for each group. For most of our tests, we find that the tick and bid tests affect stocks the same no matter how large or small or how active are the stocks. In particular, we find that the tick and bid tests result in a lower percentage of short sale volume for most size and activity levels. We also find that the tick and bid tests result in

lower bid and ask depth for most size and activity levels. Thus, the bid and tick tests do not affect liquidity in a way related to the size or activity level of a stock. Finally, the tick and bid tests do not affect returns at or following the start of the Pilot whether the stocks are large or small. On the other hand, the size and activity levels appear to matter for the effect of price restrictions on volatility and for routing decisions. The bid test affects routing decisions more in smaller stocks. Likewise, the bid and tick tests dampen permanent price volatility in small stocks while amplifying it in large stocks.

The remainder of this report is organized as follows. In section II, we recount the history of price restrictions, including Regulation SHO. Section III contains an overview of the academic literature relating to the tick test and the bid test. The data and construction of the samples are described in section IV. Section V explains the empirical methods used in the analyses. In section VI, we present our main analysis of the effect of removing price restrictions for pilot and control stocks over the first 6 months of the Pilot Period. More specifically, in section VI-A, we present our analyses of how eliminating price restrictions has affected the overall level of short volume and short interest, option market volume and open interest, and the frequency and duration of upticks or upbids within the day. In section VI-B, we present our analysis of how the removal of price restrictions has affected market quality, including measures of spreads and intraday volatility. In section VI-C, we report our results on whether lifting price restrictions has affected underlying stock prices or returns, the skewness of returns distributions, the incidence of positive and negative spikes, and the tendency of positive and negative shocks to subsequently reverse. In section VII, we investigate whether price restrictions affect all stocks similarly or whether certain types of stocks, such as small stocks, are more affected by the rules. Section VIII summarizes and concludes the report.

II History of Price Restrictions

This section briefly summarizes the historical background of the price restriction rules.[17] After the market crash of 1929, a popular view emerged that short sellers exacerbated the crash.[18] Public concerns about short selling became particularly acute in the aftermath of the international currency crisis of September 21-22, 1931, prompting Senator Arthur Capper of Kansas to introduce several bills aimed at restricting and taxing short selling. It was in this environment, on October 6, 1931, that the NYSE required that all sell orders must be marked long or short.[19] According to Meeker (1932, p. 147), this effectively acted as a rule against shorting on a downtick, as such trades were viewed as violations of the Exchange's rule against "demoralizing" trades.[20]

Shortly after its creation in 1934, the Commission recommended sixteen rules that all national securities exchanges should adopt. Among them was a recommendation for an explicit rule against shorting on a downtick:

> No member shall use any facility of time exchange to effect on the exchange a short sale of any security in the unit of trading at a price below the last sale price of such security on the exchange.[21]

Exceptions were specified for odd-lot trading and to allow regional exchanges to bring their prices in line with the primary exchange. Sixteen exchanges adopted this rule in 1935.[22]

Following sharp price drops in the fall of 1937, the Commission performed a study of the transactions of 20 securities on the NYSE for the periods September 7-13 and October 18-23 of that year[23] and found that short sales constituted a significant portion of the transactions in the declining market. The Commission adopted new short-selling rules, including a rule to formally define what is meant by a short sale and Rule 10a-1, the tick test.[24] This version of the tick test prohibited short sales "at or below the price at which the last sale, regular way, was effected on such exchange." The rule was adopted on January 24, 1938 and went into effect February 8, 1938.

The tick test was amended March 10, 1939 to allow for short selling at a zero uptick, or in other words at the last trade price, "provided that the last sale price was higher than the last different price which preceded it."[25] Certain exemption letters have been granted over the years, such as the exemption for diversified exchange traded funds.[26] However, the basic structure of this rule has remained essentially unchanged since 1939.

The Commission's Special Study (1963) identified three objectives of the tick test, which have been consistently used by the Commission as a framework for discussing the effectiveness of the regulation. These objectives are that the rule should:

(1) Allow relatively unrestricted short sales in an advancing market;
(2) Prevent short selling at successively lower prices, thus eliminating short selling as a tool for driving the market down; and
(3) Prevent short sellers from accelerating a declining market by exhausting all remaining bids at one price level, causing successively lower prices to be established by long sellers.

In 1976, the Commission proposed three alternative temporary rules that would have suspended the tick test for some or all registered securities.[27] In response to the proposal, several market participants, including the NYSE, opposed the proposal, and expressed concerns that abolishing the tick test might lead to increased volatility or decreased liquidity. The Commission withdrew the proposals in 1980.[28]

A House Report submitted by the Committee on Government Operations dated December 6, 1991 discusses several aspects of short selling, including the tick test.[29] The report suggests that short selling has negative price effects that "can have important and lasting consequences" and asserts that the tick test is "effective in stabilizing the market for exchange-listed stocks for the benefit of issuers and investors," although no evidence is cited in support of this view. The report also recommends that the tick test should be extended to the Nasdaq market.

On September 6, 1994, the Commission approved NASD Rule 3350 (the "bid test") as a temporary rule.[30] This created a bid test for trades executed by NASD members or their customers, but with exemptions for both equity and option market makers. Specifically, this rule prohibited short sales at or below (or less than one penny above) the best bid price whenever the prevailing inside bid price is lower than the previous inside bid. The bid test might appear less restrictive than the tick test, because it allows for unrestricted short selling at any price when the bid price is higher than the previous bid, and because of the market maker exemptions. Since its

initial approval, the bid test has been re-approved annually as a temporary rule.[31] The bid test was in effect when Regulation SHO became effective in January 2005. When Nasdaq began operating as an exchange in August 2006, NASD Rule 3350 was replaced by Nasdaq Rule 3350 and NASD Rule 5100.[32]

The Commission re-opened the discussion on Rule 10a-1 in a concept release dated October 20, 1999.[33] In this release, the Commission requested comment on numerous issues surrounding the tick test, including:

- whether the tick test should be suspended when the daily stock return is above a threshold level;
- whether actively traded securities should be exempted from the tick test;
- whether the restrictions should apply only around certain market events such as at the open and close, around mergers and acquisitions, or at option expirations;
- whether hedging transactions be exempt from the tick test;
- whether the tick test should be revised in response to expanded after-hours trading or decimalization;
- whether the tick test should be extended to non-exchange-listed stocks; and,
- whether the tick test should be eliminated.

In October 2003, the Commission proposed a rule that would create a uniform bid test that would apply to both Listed and Nasdaq NM Stocks, with various exemptions.[34] In addition, the Commission proposed a pilot program that would suspend the tick test for actively-traded securities for two years.[35] As stated in the proposing release, "[t]he temporary suspension would allow the Commission to study the effects of relatively unrestricted short selling on market volatility, price efficiency, and liquidity."[36]

---

[31] Most recently, see SEC Release No. 34-53093, January 10, 2006.
[32] Nasdaq NM stocks are currently trading under an exemption from Rule 10a-1 in order to maintain the status quo until the conclusion of the Pilot or any further rulemaking by the Commission.

[35] See SEC Release No. 34-48709, October 28, 2003.
[36] See SEC Release No. 34-48709, October 28, 2003.

With the adoption of Regulation SHO in July 2004, the Commission decided to defer consideration of the uniform bid test and the proposed exemptions (proposed Rule 201), in order to first observe the results of the pilot program.[37] In connection with the establishment of a Pilot, the parameters governing a Pilot were expanded to include a broader spectrum of securities than envisioned in the proposing release, and the length of the Pilot was shortened to one year. As stated in the adopting release,

> the purpose of the Pilot is to assist the Commission in considering alternatives, such as: (1) eliminating a Commission-mandated price test for an appropriate group of securities, which may be all securities; (2) adopting a uniform bid test, and any exceptions, with the possibility of extending a uniform bid test to securities for which there is currently no price test; or (3) leaving in place the current price restrictions.

The details of the program, including the list of securities included in the Pilot, were specified in the Commission's Pilot Order of July 28, 2004.[38] The Pilot was originally scheduled to begin on January 3, 2005 and last for one year. However, because the industry needed more time to prepare their systems, the start date was postponed until May 2, 2005, and later, the terminal date of the Pilot was extended until August 6, 2007 to maintain the status quo for pilot stocks until the Commission evaluates the results of the study and considers potential rulemaking on price restrictions.[39] The Pilot Order suspends Rule 10a-1 and the bid test for approximately a third of the Russell 3000 stocks. The methodology for selecting the pilot stocks is detailed in the Pilot Order, and is summarized in section IV, below.

III Previous Evidence

The previous evidence on price restrictions gives us insight into how price restrictions work. In particular, it examines the effectiveness of the rules and the effect that the rules have on

[37] SEC Release No. 34-50103, July 28, 2004.
[38] SEC Release No. 34-50104, July 28, 2004.
[39] SEC Release No. 34-53684, April 20, 2006.

market quality. We are unaware of a previous study that compares the tick test to the bid test. Several concurrent studies also examine the effect of the Pilot on the tick and bid tests (Alexander and Peterson (2006), Diether, Lee, and Werner (2006), and Wu (2006)). These studies are summarized on Appendix A.

A. Effectiveness of the Rule

1. Shorting in a Declining Market

Several studies examine whether the rules appear to keep short sales from executing in declining markets. When Rule 10a-1 was adopted in 1938, it was motivated in part by a Commission study of short selling, based on two weeks of data in 1937. This study found that when a downtick rule applied, a substantial amount of short selling occurred during periods when the market was declining.[40] Two subsequent studies produced by staff at the Commission found that the tick test allows short selling in declining markets.[41] The Commission's 1963 Special Study concluded that Rule 10a-1 was not effective at achieving its objectives, stating that

> [p]resent rules appear inadequate to relieve the added pressure that short selling may create during a severe decline in the general market or a declining price trend in a particular security. Despite the rules, a relatively large volume of short selling occurred in particular stocks, including "market leaders" and "trading favorites," during the period of decline preceding the market break of May 28, 1962, and at critical junctures on that day, and many additional opportunities existed when short selling could have occurred.[42]

In a more recent study, Ferri, Christophe, and Angel (2004) examine short selling in a matched sample of Nasdaq National Market stocks, which were subject to the bid test, and Nasdaq SmallCap stocks, which were not, during a period of high volatility and rapidly declining

[40] The NYSE had a downtick rule prior to the Commission's tick test. A downtick rule is a weaker form of the tick test because it allows trading at the most recent price even if that price was a downtick.
[41] The Securities and Exchange Commission (1963), in the Special Study, examined the trading activity leading up to and during the market break of May 28, 1962. In a working paper by SEC staff, Marcotte and Martin (1977) study the tick test for the period from September 20 through October 15, 1976, during which time the Dow Jones Industrial Average fell by 8.12%. The results are summarized in Pollack (1986).
[42] 88th Congress, HR Doc No 88-95 (1st session, 1963), pp. 293-294.

stock prices (September 2000-August 2001). In their sample of 2,275 observations, they find no significant differences in the overall level of short selling, or the frequency of days with abnormally negative returns and abnormally high short selling.

Overall, the research above shows that short sales are executed in declining markets despite the application of the tick or bid tests. However, this does not mean that short sales are unaffected by the tick and bid tests. We discuss this further in the next section.

2. Short Sale Execution Quality

Another area of research examines whether these rules harm the execution quality of short sales by reducing the prices received by short sellers, by delaying the execution of short sales, or by reducing the fill rates.

Martin and Marquette (1977) conduct a simulation calibrated to the Dow 30 stocks, to estimate the degree to which the rule would have affected execution prices for market short sale orders submitted during this period of market decline. The simulation results indicate that even during this period of rapid price declines, randomly arriving short market orders would have executed at higher prices as a result of the uptick rule. Therefore, short sellers appear better off because of the tick test.

Albert, Smaby, and Robison (1997) examine the negative abnormal returns to stocks following large increases in reported short interest, as an estimate of the profitability of short selling. They find that short selling was more profitable for their Listed sample than their Nasdaq sample during a period (1987-1991) when only Listed Stocks were subject to a price restriction. Their findings imply that the uptick rule does not have a significant impact on the bottom line for short sellers.

While studying order data from the NYSE, Angel (1997) and Alexander and Peterson (1999) find that the tick test prevents short sales from demanding liquidity more than 90% of the time. As expected, the degree to which the tick test is binding depends on whether the market is rising or falling. Likewise, McCormick and Reilly (1996) find that the Nasdaq bid test prevents short sellers from demanding liquidity roughly 35% of the time. This proportion was found to be an increasing function of trading volume and, not surprisingly, a decreasing function of the day's stock return.

Both Angel (1997) and Alexander and Peterson (1999) conclude that Rule 10a-1 significantly impedes order execution quality for short sales, even in rising markets. For those cases where the stock price increased, short sellers can trade at the bid less than fifteen percent of the time. According to Alexander and Peterson (1999), the tick test appears to contradict the Commission's first stated objective for short selling regulation, to "allow relatively unrestricted short selling in an advancing market."

In addition, Alexander and Peterson (1999) also found that short sale orders have significantly lower execution rates and significantly longer times to execution than regular sales. Alexander and Peterson (2002) study how the tick test was affected by the reduction of the tick size from 1/8 to 1/16 in June 1997. As predicted, their evidence suggests that short sales were executed faster and at better prices after the reduction in tick size, confirming that the tick test is less binding when the tick size is smaller.

In summary, previous research shows that short sellers can receive better prices as a result of the tick test and that the tick test does not impede profit opportunities. However, the tick test and bid test restrict the ability of short sellers to demand liquidity even in rising markets.

This results in execution delays and lower fill rates. Tick size changes have lowered these costs, but short sellers are still precluded from demanding liquidity much of the time.

3. Manipulation

Many of the studies that examine the ability to short in a declining market do not address the question of whether short selling in a declining market increases the potential for manipulating a stock price below its fair value, or conversely, whether short selling helps prices adjust more quickly to their efficient values. Nor do the studies address the question of whether a tick test or bid test would have been effective at reducing the amount of short selling during declining markets. A few early studies of short selling in the 1930s concluded that there was no evidence that short sales had any material effect on the magnitude of price swings.[43]

Ferri, Christophe, and Angel (2004) come a little closer to questioning whether the bid test inhibits trading that may be indicative of manipulation. On days when stock prices are declining, the degree of short selling is positively related to returns for Nasdaq SmallCap stocks, which are not subject to the bid test, but not for matching Nasdaq NM stocks, which are subject to the bid test. This result is the reverse of what one would expect to see if the bid test helps prevent short sellers from pushing down prices. The authors conclude that "a bid test is unnecessary for investor protection."

B. Effect on Market Quality

Because the tick and bid tests appear to have some impact on the execution of short sales, even though short sales can still execute in declining markets, we might expect the tick and bid test to affect market quality. In a recent working paper, Jones (2003) re-examines the period surrounding the initiation of the tick test in the 1930s. He finds a significant reduction in bid ask

[43] See Twentieth Century Fund (1935), Macaulay and Durand (1951).

spreads and positive abnormal stock returns surrounding the initiation of the downtick rule on October 6, 1931, with no significant changes in trading volume, volatility, or the price impact of trades. He also finds similar results surrounding the initiation of Rule 10a-1 1938. He concludes that

> [b]ecause the uptick rule no longer constrains shorting as much as it once did, any liquidity effects are likely to be much more modest than the ones identified in the 1930's. However, it would not be surprising if repeal of the uptick rule were to lead to some reduction in individual stock liquidity, particularly in less liquid stocks.[44]

In research sponsored by NASD, McCormick and Reilly (1996) find that the introduction of the bid test did not have a substantive impact on market quality, as measured by volatility and bid ask spreads. A more comprehensive follow-up study by McCormick and Zeigler (1997), which was also sponsored by the NASD, supports the original finding that the implementation of the bid test had little or no impact on market quality. They find that quoted and effective spreads were narrower in 1997 than in 1994, but they attribute the changes to a gradual improvement in market quality over time, and not to the implementation of the bid test. They find no significant change in quoted spreads as a result of the bid test. While they do find a statistically significant decline in effective spreads, this is a natural consequence of a rule that forces short sellers to act as liquidity suppliers rather than liquidity demanders. Because the improvement in effective spreads is coming at the cost of delayed executions, it does not necessarily signify an improvement in market quality.

Au-Yeung and Gannon (2003) estimate the joint dynamics of index and index futures returns in Hong Kong, surrounding the elimination of Hong Kong's uptick rule on March 25, 1996. Using a multivariate GARCH framework, they find evidence that Hong Kong's uptick

[44] This study was funded by the New York Stock Exchange.

rule was impeding price discovery on the index relative to the futures contract, and that conditional volatility for the index declined with the elimination of the uptick rule.

Overall, this evidence seems to indicate that tick tests can lead to narrower bid ask spreads, but impedes price discovery, while the bid test should not have any discernable effect on market quality. The construction of the Pilot study improves upon the design of these previous studies and allows us to study these issues in a more controlled environment.

IV Construction of the Samples

A. Selection of Pilot and Control Stocks

The stocks in the pilot sample are those specified in the Pilot Order.[45] Stocks were selected for this sample by sorting the 2004 Russell 3000 first by listing market and then by average daily dollar volume from June 2003 through May 2004, and then within each listing market, selecting every third company starting with the second. Because the selection process relied on average daily dollar volume, companies that had their initial public offering in May or June of 2004, just prior to the Russell reconstitution, were not included. The 32 stocks that are not listed on the NYSE, Amex, or Nasdaq NM were also excluded prior to sorting and selecting the pilot stocks.

While no companies have moved in and out of the Pilot, the pilot stocks might experience ticker symbol changes, listing changes, and mergers. We collected the necessary change information from NYSE, Amex, and Nasdaq, who keep track of and disseminate these changes. In the case of mergers between pilot and control stocks, the status of the resulting company is the same as the status of the company with the larger market capitalization of equity on the day prior to the first merger announcement. The pilot stocks that did not survive to the start of the Pilot on

[45] SEC Release No. 34-50104, July 28, 2004.

May 2, 2005 are not included in the analysis. Pilot stocks with listing changes during the Pilot are included in our analysis up until the date of the listing change even though they are still in the Pilot..

The stocks in the control sample come from the remainder of the 2004 Russell 3000 not included in the Pilot. We do not include the stocks with initial public offerings after May 2004 because these stocks were not eligible to be selected for the Pilot. Like the pilot sample, the control sample stocks can experience corporate events that make tracking them difficult. We keep track of ticker symbol changes, listing changes, and mergers using the daily symbol directories from the Nasdaq Trader web site and using Bloomberg. As with the pilot sample, we include only the control stocks that survive until May 2, 2005 and include stocks that are subsequently delisted up until the delisting date.

Table 1 reports the sample sizes and breaks down the sample in various dimensions. As the table indicates, our sample contains 504 listed pilot stocks and 973 listed control stocks that are subject to Rule 10a-1 and 439 Nasdaq pilot stocks and 917 Nasdaq control stocks that are subject to NASD Rule 3350. Table 1 also indicates that roughly 70% of Listed Stocks and 63% of Nasdaq NM Stocks have listed options. Because listing affects the short sale rules applied to trading, we report results for each of these sub-samples but not for the full sample. If an issuer switches its listing from Nasdaq to Amex or NYSE or vice versa after May 2, we keep that stock in the sample up until the day of the listing change. If an issuer changed its listing prior to May 2, it will be grouped according to its new listing and we include pre-period data only from that same listing.[46] Listings changes between Amex and NYSE do not affect our sample because the change does not affect the short sale rule applied.

[46] We exclude one stock that changed its listing on the first day of the pilot, Renasant Corporation RNST, formerly Peoples Holding Company, PHC.

Similarly, we keep stocks in our sample up until their last listed day even if they are acquired or otherwise move to markets that do not apply the same rule (i.e., move to the Nasdaq Capital Market, OTCBB, or the Pink Sheets) after May 2, 2005. We keep these stocks to avoid a survivorship bias, which is a bias associated with finding higher average returns than actually exist. We believe an analysis of the pilot would be particularly sensitive to survivorship bias and we therefore, make every effort to reduce it. Further, if an issuer moves its listing from Nasdaq to an exchange or from an exchange to Nasdaq, we keep the stock in the sample up until the list/delist date. We do this so that our analysis does not confuse the effects of the tick test with those of the bid test. Because we retain stocks in our sample until the stocks delist, our sample size on our last sample day (October 31, 2005) is smaller than our sample size on the first pilot day (May 2, 2005). In fact, we have about 88 fewer stocks in our sample on October 31 than we do on May 2. Despite the drop in sample size, the pilot stocks comprise about 1/3 of the sample stocks for both Listed and Nasdaq NM Stocks on October 31 as well as May 2.

B. Data and Sample Statistics

We examine these pilot and control stocks over a 210 day period in 2005. We examine the 82 day period from January 29 to April 29 as the Pre-Pilot Period during which the pilot and control stocks are subject to the same rules. The Pre-Pilot Period allows us to test whether the pilot and control stocks appear similar when they are subject to the same rule and it gives us a reference point to examine how the sample stocks change when the price restriction rules are removed. In the results section, this period is compared to the 128 day period from May 2, the first day of the pilot, to October 31, 2005.

Before comparing the Pre-Pilot Period to the Pilot Period, we first examine whether the pilot and control samples appear comparable over the Pre-Pilot Period. Table 2 gives this comparison separately for Listed and Nasdaq NM Stocks. The statistics are daily levels averaged over the Pre-Pilot Period. We use trade and quote data obtained from the Securities Industry Automation Corporation (SIAC) to estimate stock volume, price, spread, depth, and intraday returns, data from the Center for Research in Securities Prices (CRSP) to estimate market capitalization and daily returns, data from the Option Price Reporting Authority (OPRA) to estimate option volume and open interest, and the SRO Pilot data to estimate short selling levels.[47] Short interest, reported monthly, comes from the NYSE, Amex, and Nasdaq. Most of the measures in Table 2 are qualitatively similar for pilot and control stocks, according to a statistical t-test run at the 95% and 99% confidence levels (also stated as 5% and 1% significance levels). This evidence suggests that the two groups are a good match and supports the validity of further comparison of pilot and control stocks.

The statistics of Table 2 are divided into groups. The first group of statistics measures general stock characteristics such as volume, price, market capitalization, and short interest. The first three rows of Table 2 show that the pilot stocks have similar average volume to the control stocks whether volume is measured by the number of trades per day, the average daily share volume, or turnover. The average volume-weighted average price (VWAP) and average market capitalization diverge slightly. For both Listed and Nasdaq NM Stocks, the VWAP is higher for pilot stocks but the market capitalization is lower. Neither difference is statistically significant.

[47] The SRO Pilot data refers to the short selling records available from each of nine markets: American Stock Exchange, Archapelago Exchange (now a part of NYSE Group), Boston Stock Exchange, Chicago Stock Exchange, NASD, NASDAQ Stock Market (now NASDAQ Stock Exchange), New York Stock Exchange (now a part of NYSE Group), National Stock Exchange, and the Philadelphia Stock Exchange. This analysis aggregates the short selling data without regard to whether there exists a SIAC report for the short sale transaction.

The next group of statistics measures the level and nature of short selling. These statistics measure short interest, the short selling volume and location, and option volume and open interest. In Listed Stocks, short selling comprises about 24% of share volume and 27% of trades. The level jumps to 36% of share volume and 37% of trades in Nasdaq NM Stocks. Still, the level of short selling in pilot stocks is similar to that of control stocks prior to the start of the pilot. Because the bid test does not apply to all markets, we examine the share of short sales executed on Nasdaq to measure whether investors appear to be routing short sales away from Nasdaq. While we estimate this statistic for Listed Stocks as well, we focus on the Nasdaq NM Stocks for results. Rows ten to fifteen of Table 2 show that prior to the pilot, the pilot and control stocks have similar average option volume and open interest, statistically indistinguishable from each other.

The next set of statistics measures mechanical aspects of trading and quoting, in particular, the percentage of trades occurring on a downtick or zero downtick and the percentage of the day during which the last change in the bid was downward. These measures were selected because they both determine when a short sale can be executed and are influenced by the application of the price restrictions. Prior to the pilot, about 46% of trades in Listed Stocks occur on downticks or zero downticks, while slightly over 50% of trades in Nasdaq NM Stocks do. These percentages are similar for the pilot and control stocks. Likewise, the percentage of the day during which the most recent change in the bid was downward is similar for pilot and control stocks. For Listed Stocks, the most recent change in the bid was downward for about 39% of the day. This is indicative of the nature of a limit order book market to have short-lived liquidity imbalances followed by long periods of liquidity building. In other words, a large order quickly executes, removing several price levels in the limit order book, followed by a slow replenishing

of the limit order book. In the Nasdaq market, which operates more like a dealer market than the listed market, stocks spend more time in a downbid situation, about 47% of the time.

Liquidity is the next important group of statistics. We measure displayed liquidity using quoted and effective spreads measured in absolute terms and also relative to prices, and using aggregated quoted ask and bid depth at the National Best Bid and Offer (NBBO). We measure realized liquidity using the NBBO for both Listed and Nasdaq NM Stocks. Like the earlier measures, the liquidity measures show that the pilot and control stocks are statistically similar for all measures. While the magnitude of some of the measures, particularly the quoted ask depth and quoted bid depth, appears higher for control stocks than for pilot stocks, the measures are actually statistically similar.

The final group of statistics gives the distribution of returns and prices over various periods. Table 2 gives average returns, average absolute returns, the skewness of the returns, and the variance of the returns over 5 minute, 30 minute, and 1 day periods. It also shows the daily price range and three variance ratios. The variance ratios measure the transitory volatility by comparing the variance of returns measured over short and long horizons. Overall, the pilot and control samples are statistically similar in the means, skewness, and transitory and total volatility. It is interesting to note that the returns for all samples and all horizons are positively skewed. This positive skewness has been documented in previous work and is correlated with short selling restrictions.

V Methods

A. Comparing Pilot and Control Stocks

We derive the results in this report using several empirical approaches. The first approach compares the pilot sample to the control sample both before and after the start of the pilot. The approach allows us to apply a standard t-test to the difference of the differences. As long as the pilot and control samples are generally well constructed, this approach will control for changes in market conditions that are unrelated to the pilot. However, this approach may not fully control for differences within the samples. Further, it is cumbersome when examining the differential effect of the pilot on sub-samples. Therefore, we will also employ a regression approach.

The regression approach includes multiple test variables at the same time and also controls for unforeseen differences between the pilot and control samples. Because the number of stocks changes over the sample period, we employ daily cross-sectional regressions for each sample day after the start of the pilot and then we average the coefficients. We employ variations on the following regression:

$$\text{Market Quality}_i = \alpha + \beta_1 \text{Pilot}_i + \beta_2 \text{Pre Pilot Market Quality}_i \quad (1)$$

where Market Quality is one of several dependent variables (e.g., effective spread) measured for each stock on one trading day, Pilot is equal to one for pilot stocks and zero for other stocks, and Pre-Pilot Market Quality is the average daily level of the dependent variable measured over the Pre-Pilot Period. If the dependent variable is generally larger for pilot stocks than control stocks, then β_1 will greater than zero. If this relation is persistent across time, then the average β_1 will be greater than zero. The Pre-Pilot Market Quality variable helps ensure that the coefficients on the

indicator variables measure the effect of removing price restrictions. It also helps to control for any unforeseen differences between the pilot and control stocks.

We run all tests separately for stocks listed on an exchange and stocks listed on Nasdaq NM because the rule applied to trading of Nasdaq NM Stocks is different than the rule applied to the trading of stocks listed on exchanges.[48] This allows us to satisfy one purpose of the Pilot, which is to clearly distinguish the effect of each type of rule.

B. Behavior of Stock Prices Surrounding the Pilot Initiation

In order to evaluate whether the tick test or the bid test affects the level of stock prices, we examine average daily returns and average cumulative returns for pilot and control stocks over a 21-day period surrounding the beginning of the pilot. If pilot stocks are over-valued because of the price restrictions these returns should be significantly negative for pilot stocks relative to the control stocks on or around the first day of the pilot. Cumulative returns are normalized to zero on April 29, the trading day prior to the start of the pilot.

We believe it likely that any valuation effects of the pilot that are not already impounded into the price before the start of the pilot would most likely be observed immediately upon the initiation of the pilot, and reflected in the returns on the first day. However, we also consider the possibility that the effects of the pilot might be manifest over a longer time period. Therefore, we also examine returns over a six month time horizon. To avoid a survivor bias, we compound returns to the six month horizon if a stock falls out of the sample prior to October 31, 2005. In addition, to control for the systematic risk of a stock, we estimate an alpha for each stock. We estimate these alphas in-sample using the market model:

[48] It is worth noting that neither the bid test nor tick test applies to the trading of Nasdaq NM stocks on exchanges.

$$R_t = \alpha + \beta R_{Mt}$$

where R_t is the return on the stock in day t, and R_{Mt} is the equally-weighted market index return from CRSP for that day. We also estimate the tendency of the alphas to be significantly positive or negative. Pilot stocks might be more likely to have negative alphas than control stocks if either price restrictions corrected over-pricing over long horizons or if price restrictions prevent constant short selling pressure from pushing prices below their equilibrium level. Pilot stocks might be less likely to have positive alphas if price restrictions facilitate over-pricing.

C. *Measuring Large Price Reversals*

As part of our analysis of whether price restrictions inhibit price patterns that may be indicative of short-term price manipulation, we wish to examine the frequency of large short-term price movements that are immediately reversed. Although such price reversals, or "spikes," are bound to occur with some frequency due to the natural variation of prices, they may also be a sign of price manipulation. If the price patterns indicative of manipulation are more prevalent on the short side than on the long side, we would expect to see more negative price spikes than positive ones. And if price restrictions are effective at reducing the potential for price manipulation, we might expect to see significantly more price spikes for pilot stocks than control stocks.

To investigate this, we define the following measures of short-term price reversals:

$$Negative: \min(-R_{t-1}, R_t^L)/\sigma_i$$
$$Positive: \min(-R_t^L, R_{t-1})/\sigma_i$$

In these formulas, σ_i represents the holding period (non-annualized) standard deviation of returns on stock *i,* measured using data in the Pre-Pilot Period, R_t is the simple one-period return

on stock *i* at time *t*, and R_t^L is the one-period return measured as a percentage of the lagged stock price:

$$R_t = \frac{P_t - P_{t-1}}{P_{t-1}} \qquad R_t^L = \frac{P_t - P_{t-1}}{P_{t-2}},$$

where P_t represents the price of stock *i* at time *t*. We estimate these metrics using 5-minute and 30-minute horizons. The return as a percentage of the lagged price is used in the measure so that the adjacent returns will be compared on the same basis.[49]

We normalize the reversal measure by the standard deviation of returns on the same stock, computed using the same return interval over which the reversals are measured, in order to ensure that the measure will capture reversals that are large in magnitude compared to the typical movement on the stock. The standard deviation is computed using only pre-pilot returns data, so that the measure will not be affected by any changes in volatility that may be related to the pilot.

By definition, a "negative reversal" only occurs in periods when there is a negative return followed by a positive return—otherwise, the negative reversal measure is equal to zero. If a stock experienced a negative return of 3 standard deviations that was fully reversed in the next period, our negative reversal measure would be 3. If a return is only partially reversed, only the portion that is reversed is counted in the measure.

We do not test whether this measure changes across Pre-Pilot and Pilot Periods because the Pre-Pilot Period is already used to normalize the measure. Rather, we focus on differences between the control and pilot samples during the Pilot Period. In order to test whether the frequency of extreme reversals differs across the two samples, we use a nonparametric bootstrapping methodology that does not require any assumptions about the probability

[49] For example, if a stock price increases from 40 to 50 and then returns back to 40, this corresponds to a 25% return followed by a -20% return. In our measure, we would compute the negative return as a percentage of the original price, which would make it a -25% return.

distribution of returns or return reversals. Essentially, this method estimates the likelihood of observing a particular number of reversals under the null hypothesis that the distribution of reversals in the pilot sample is the same as the distribution in the control sample. This is implemented as follows. For a given "threshold" level of the reversals measure, we count the number of reversals in the pilot sample that exceed that threshold. We then select from the control sample (with replacement) a random sample of reversals equal in size to the pilot sample. Within this randomized sample, we count the number of reversals exceeding the threshold, and observe whether the number is higher or lower than the number observed in the pilot sample. We repeat the process 1,000 times and observe the frequency with which the number of reversals in the randomized control sample equals or exceeds the number in the pilot sample. We report the significance based on a two-tailed test—for example, the number of reversals in the pilot sample would be deemed significant at the five percent level if the a number that high occurs 2.5% of the time or less in randomized control samples.

D. *Autoregression Methodology for Measuring Reversals*

As an alternative approach to measuring the impact of the pilot on price reversals, we employ a new methodology. Similar in spirit to autoregression, this methodology involves measuring the extent to which positive and negative price movements reverse in subsequent periods. Specifically, we use intraday returns to estimate a model of the form:

$$R_t = \sum_{n=1}^{5} \alpha_n R_{t-n}^{-} + \sum_{n=1}^{5} \beta_n R_{t-n}^{+} .$$

In this equation, R_t represents the stock return in period t, and the regressors are the positive and negative components of lagged returns:

$$R_t^{-} = \min(0, R_t) \qquad R_t^{+} = \max(0, R_t) .$$

The estimated α and β coefficients measure the extent to which positive and negative returns tend to reverse or continue in subsequent periods. In a world where stock prices follow a random walk, the true coefficients would be equal to zero. Unlike an ordinary autoregression, this specification permits the degree of momentum or reversals to differ for positive and negative shocks. In either case, positive coefficients would indicate that returns exhibit short-term momentum, while a negative coefficient would indicate short-term reversals. For example, if the coefficients α_1 and α_2 were estimated to be -0.05 and -0.01, this would mean that a negative return of one percent would, on average, be followed by a positive return of five basis points in the next period, and a positive return of one basis point in the period after that. If the coefficients β_1 and β_2 were estimated to be -0.04 and -0.02, this would indicate that a positive return of one percent would on average be followed by negative returns of four and then two basis points in the next two periods. We are interested in comparing these coefficients for pilot and control stocks. If price restrictions help prevent short-term negative stock price manipulations, we would expect to see the α coefficients higher for pilot stocks than for control stocks.

E. Small and Low-Volume Stocks

One policy alternative outlined in the first Pilot Order was to extend a uniform test to all securities, including securities with a lower market capitalization or less actively traded than those included in the Pilot. While our analysis cannot directly investigate the effects of price restrictions for stocks beyond the range covered by the pilot sample, it can provide relevant evidence by investigating whether the impact of the Pilot has been substantially different for the smaller stocks than for the larger stocks in the Pilot, or whether the impact has differed for

actively traded and less actively traded issues. To examine these questions, we run a series of regression-based tests of the following form:

$$\text{Market Quality}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i + \beta_{11} \text{Pre Market Quality}_i$$

where "Market Quality" represents a characteristic of interest such as spreads, depth, or volatility. The "Decile" variables are indicator variables corresponding to each of the nine lowest deciles, for two different decile partitions. The first partition ranks stocks by market capitalization on April 28, 2005. The second partition ranks stocks by annualized turnover in the Pre-Pilot Period as measured by its average daily share volume divided by its shares outstanding as of April 28, 2005 and multiplied by 250. In each case, the decile indicators take on a value of one if the stock falls within the designated decile, and zero otherwise. These partitions allow us to test whether the price restrictions have a larger impact on certain categories of stocks. In particular, we examine each $\beta_{10} + \beta_k$ to measure whether the pilot has a significant effect on stocks in decile *k*.

VI Results and Analysis

A. The Nature of Short Selling

1. Short Selling Activity

Price restrictions may impose costs on short sellers in the form of lower fill rates and delays on execution. If these costs are economically significant, then we would expect the removal of the price restrictions to result in increased short selling. We would expect short selling to increase more for pilot stocks than control stocks if the price restrictions are costly, or be the same for the pilot and control stocks if price restrictions are not costly.

Table 3 shows how removing the price restrictions affects the level of short selling, based on three different measures, including (i) the number of shares sold short on a given day divided by the total share volume, (ii) the number of trades involving short sales, and (iii) short interest. Panel A shows the Pre-Pilot Period to Pilot Period comparison while Panel B reports the average coefficients from regression analysis. In the Listed market, short volume increases significantly from 24.4% to 26.3% of total volume in the pilot sample, while the change is not statistically significant for the control sample. A comparison of these two changes reveals that short selling volume increases by about 2% of total volume as a result of removing the tick test, suggesting that the tick test imposes economic costs on short sellers. The same conclusion can be drawn from the statistics on short selling as a percentage of trades.

Similarly, both volume and trade measures for Nasdaq NM Stocks suggest that the application of the bid test reduces short selling. The regression analysis in Panel B confirms these conclusions and also shows that the effect of the tick test is stronger than the effect of the bid test.

Although our results indicate that price restrictions appear to constrain the volume and frequency of short sales, these effects are not reflected in short interest. As indicated in Table 3, both pilot and control stocks exhibited significant increases in short interest around the time of the Pilot Period. However, none of the tests indicate any significant difference between pilot and control stocks. Both the univariate results in Panel A and the regression-based results in Panel B lead to the same conclusion: price restrictions appear to have no effect on short interest for Listed Stocks or for Nasdaq NM Stocks. The same result is observed whether short interest is measured in percentage of shares outstanding or in "days to cover."

The fact that we document statistically significant increases in short selling volume but not in short interest can be interpreted in various ways. One interpretation is that the increase in short volume is due primarily to increased short selling by parties that close out their short positions within the day—or, more generally, that the increase in short volume was accompanied by a decrease in the average horizon over which short positions are held. We should also note that the absence of a statistically significant result does not imply that no change occurred. Given that we observe short interest only monthly, it is possible that our statistical test did not have sufficient power to detect a change in short interest.

Because short sales in Nasdaq NM Stocks executed outside of the Nasdaq market are not subject to the bid test, short sellers can avoid the bid test by sending orders to markets other than Nasdaq. The removal of the bid test might result in an increase in short sales on Nasdaq in Nasdaq NM Stocks because the order routing decision might no longer be affected by the application of the bid test. The Nasdaq market share statistics in Panel A of Table 3 show that Nasdaq's market share in short sales increased 3.9% in pilot stocks and by 1.3% in non-pilot stocks. The difference of 2.6% is statistically significant, which is consistent with the non-uniform application of the bid test altering order routing decisions.

2. Option Activity

If price restrictions drive short sellers to trade options in lieu of stocks, then their removal should decrease option activity. Table 4 summarizes the changes in option trading for pilot and control stocks between the Pre-Pilot Period and Pilot Period. There are a total of 628 pilot and 1,263 control stocks that had listed options included in the analysis. Put and call option trading volume is aggregated over all classes and markets for each underlying stock on a daily basis.

Then, the put and call option trading volume is averaged across days for each stock for period before the pilot and for the period of the pilot. The change in put option trading volume is calculated as the average daily put (call) volume during the pilot minus the average daily put (call) volume before the pilot. Finally, the change is averaged across stocks to yield the results reported in Table 4. Averaging across stocks allows us to maintain the independence of the observations and perform a t-test comparing the mean of the pilot stocks to the mean of the control stocks. The results for open interest and signed option volume use the same methodology.

If the price restriction drives would-be stock short sellers to trade options to implement their investment strategies, then the lifting of the price restrictions on the pilot stocks would lead to a significant decline in option trading for pilot stocks relative to the control stocks. As indicated in table 4, between the Pre-Pilot Period and Pilot Period, we do observe a slight increase in average trading volume for calls and puts on Listed Stocks, a decrease in average trading volume of calls and puts on Nasdaq NM Stocks, and an increase the average open interest of all categories. Based on the paired *t* test, however, we find no statistically significant changes at the 5% confidence level. We also observe that open interest increased less on average for control stocks than for pilot stocks, but again, based on the two-sample *t* test, we find no statistically significant differences between the changes in the pilot and control samples.

As an additional measure, we examine signed option volume. This is computed by subtracting the change in the put volume from the change in the call volume. A positive signed option volume suggests either an increase in long side buyer speculation or a decrease in short side seller speculation. A negative signed option volume suggests either a decrease in long side buyer speculation or an increase in short side seller speculation. For example, if the change in

the call volume is -10 and the change in the put volume is -5, then the signed option volume equals -5. On the other hand, if the change in the call volume is -5 and the change in the put volume is -10, then the signed option volume is 5. Again, we find no significant difference between pilot and control stocks.

Since short sellers may use short-term options in lieu of equity short sales, Table 4, Panel B shows the results for short-term options only.[50] The results are quantitatively similar to the results in Table 4, Panel A. Thus, the conclusions drawn from Table 4, Panel A hold for short-term options.

Overall, the options market results provide no statistical evidence supporting the hypothesis that the tick test drives would-be short sellers away from the equity markets and to the options markets to trade.[51] Option trading volume of pilot Nasdaq NM Stocks show a decline in option volume relative to control stocks of 15%, but this difference is not statistically significant.

3. Mechanical Effects

Price restrictions have the mechanical effect of forcing short sellers to be liquidity suppliers instead of liquidity demanders because short sales can rarely be executed against the bid price. Therefore, we expect the removal of price restrictions to be associated with changes in quoting and trading purely because of the mechanics of the rules. In particular, Table 2 shows that about 46% of trades occur on downticks when the tick test applies. We expect that the removal of the tick test will lead to more balanced trading around 50% downticks because short

[50] Long and short-term options are identified using the Options Clearing Corporation directory as of October 31, 2005.

[51] A regression model that controlled for changes in volatility in the pre- and post-periods provided results that were consistent with those in Table 4.

sales can now execute on downticks. This effect should be more obvious in Listed Stocks than Nasdaq NM Stocks where the trades occur on downticks half the time even with the bid test.

A second potential mechanical effect is the percentage of time during the day when the most recent bid change was downward. Table 2 shows that this figure is around 39% when the tick test applies and 47% when the bid test applies. Removing either price restriction could increase the percentage of the day with down bids because short sales can more easily hit the bid to force more downbids. Conversely, if the different price restrictions can explain some of the divergence in these figures, we expect the percentage of downbids in Listed Stocks and Nasdaq NM Stocks to converge.

Table 5 shows how the tick and bid tests affect trading and quoting mechanics. The downtick rows in Panel A show that the percentage of trades on downticks increases from 46% to almost 50% in pilot Listed Stocks. Conversely, the percentage of trades on downticks in control Listed Stocks goes down. On net, the percentage of trades on downticks is fairly balanced when the tick test does not apply and is skewed toward upticks when the tick test does apply. Nasdaq NM Stocks appear to have much more balanced trading even with the bid test so that removing the bid test results smaller increase in the number of downticks. Panel B confirms the result that the tick test has a much larger effect on trading mechanics than the bid test.

The downbid rows in Table 5 measure the percentage of the trading day during which the most recent bid change was downward. Pilot Listed Stocks experience a small increase in the prevalence of downbids but this increase is roughly similar to an increase experienced by control Listed Stocks. The results show a decline in the prevalence of downbids for pilot Nasdaq NM Stocks, suggesting that short selling under the bid test might shorten the duration of upbids, reflecting the restriction that short sales can only hit upbids.

B. Market Quality

1. Liquidity Measures

Because price restrictions alter how orders transact with each other, they have the potential to alter traditional measures of liquidity. In particular, the price restrictions will often keep a short sale from executing against the bid quote. Therefore, we expect the depth at the bid quote to be lower without price restrictions. If a short sale can not execute against the bid, it often adds depth to the ask quote, and hence, the depth of the ask might be lower without price restrictions. Alternatively, a restricted short sale might set a lower ask price and an unrestricted short sale might exhaust the depth at the bid resulting in a lower bid price. Either way, short sale price restrictions can result in a narrower quoted bid-ask spread.

While quoted spreads and depths measure the displayed supply of liquidity, the effective spread measures liquidity actually available to investors. Therefore, an examination of effective spreads is necessary to understand the effect of price restrictions on liquidity. Because price restrictions can affect the displayed liquidity, we might also expect them to affect the actual liquidity as well.

Table 6 shows results on the effect of price restrictions on liquidity. For the pilot sample, the ask depth decreases for Listed Stocks but increases for Nasdaq NM Stocks. The control sample experiences an increase in depth at the ask. Comparing the changes reveals that the ask depth of the pilot stocks decreased relative to the ask depth for the control stocks in both Listed and Nasdaq NM Stocks. This change is significant for Listed Stocks in both the univariate and regression-based tests, but is significant for Nasdaq NM Stocks only in the regression-based tests

in Panel B. Panel B also shows that the ask depth is augmented about three round lots more when a tick test applies than when a bid test applies.

The bid depth results in Table 6 are slightly different than the ask depth results. The bid depth increases for all sub-samples, but the difference between the pilot and control samples is not significant in Panel A, while Panel B suggests that the bid depth of the pilot stocks does not increase as much as the bid depth of the control stocks. This effect is larger for Nasdaq NM Stocks than for Listed Stocks, therefore, the bid test seems to augment the bid depth more than the tick test does by about one round lot.

We examine two measures of quoted spread. The first, known as the "absolute spread," is simply the difference between the ask price and the bid price, measured in pennies. The second, called the "relative spread," is the absolute spread divided by the bid-ask midpoint, thus measuring the displayed cost to trade as a percentage of the stock's value. Panel A shows that the quoted spreads did not change much when the pilot started for either the pilot stocks or the control stocks. Only the relative quoted spread in control stocks saw an increase but that increase was not statistically different from the change in relative spreads experienced by the pilot stocks. The conclusions from Panel B give a more mixed picture. Quoted spreads decline about 0.3 cents more for pilot stocks, a result that is the same for Listed Stocks and Nasdaq NM Stocks. This result suggests that the tick and bid tests appear to reduce liquidity. However, the results on relative quoted spreads yield the opposite conclusion. While these results are statistically significant, the point estimates are fairly small. The quoted spreads decline by less than half a penny and the relative quoted spread increases by less than a basis point. Taken together, these results suggest that the tick and bid tests have a slight effect on quoted spreads, if any.

In addition to quoted spreads we also examine effective spreads, estimated for each trade by computing the absolute value of the difference between execution price and the current bid-ask quote midpoint. As we did for the quoted spread, we estimate both absolute and relative effective spreads. The effective spread results in Panel A of Table 6 look quite similar to the quoted spread results. Only one of the changes is statistically significant, a decline in the effective spread of pilot Nasdaq NM Stocks. This result alone would suggest that the application of the bid test decreases liquidity. However, this conclusion is weakened by the lack of statistical significance in the other sub-samples and the lack of a difference between the pilot and control stocks. The Panel B results suggest that the tick test has no impact on effective spreads, but the results on the bid test are mixed. The bid test appears to decrease effective spreads and increase relative effective spreads. Like the results on quoted spreads, the magnitudes of these changes are small.

Overall, the Regulation SHO Pilot shows us that the price restrictions appear to augment depth at both the ask price and the bid price, but price restrictions have little if any effect on realized liquidity. These results are fairly consistent whether the price restriction is structured as a tick test or as a bid test, although the tick test augments the ask depth more and the bid test augments the bid depth more.

2. Return Volatility

The next set of tests examine whether removing the price restrictions alters return volatility. Table 7 displays test results for several volatility measures and several return horizons to capture different aspects of volatility.

The daily price range measures the degree to which prices fluctuate within a day by comparing the high price to the low price in a day. The daily price range declines from the Pre-Pilot Period to the Pilot Period for each subsample. This decline is statistically significant for both Listed and Nasdaq control samples and for the Nasdaq pilot sample, but not for the Listed pilot sample. Panel A suggests that the decline was statistically similar for pilot and control stocks, while the Panel B regression suggests that the daily price range increased for pilot stocks relative to control stocks for both the Listed and Nasdaq samples. Taken together, the daily price range results are mixed on whether the tick and bid tests dampen volatility.

To explore intraday volatility further, we examine our next two volatility measures, absolute returns and return variance, over three time horizons, 5 minutes, 30 minutes, and one day.[52] These measures would increase for pilot stocks over the shorter horizons if the tick and bid tests dampen transitory volatility. The measures would increase for the pilot stocks over the longer horizons if the tick and bid tests dampen permanent volatility. Economically, transitory volatility captures the efficiency of the trading mechanism while permanent volatility captures the effects on equilibrium prices. We separately analyze absolute returns and return variance because each measures volatility slightly differently. Return variance has a tendency to put more weight on larger price movements than absolute returns.

The average absolute returns are lower during the Pilot Period for the control sample across all three return horizons. The univariate results in Panel A show that the pilot stocks experienced a statistically similar decline in the absolute returns as the control stocks for the 30 minute and daily horizons. At the five-minute horizon, however, the pilot sample experienced an increase in absolute returns relative to the control stocks for both Listed and Nasdaq NM Stocks.

[52] The 5 and 30 minute absolute returns and variances are estimated without including the first half hour of the trading day, after hours trading, or pre-open trading.

The regression results in Panel B confirm this finding and shows that the effect is larger for Listed Stocks. Panel B also confirms the results for the daily horizon but indicates that absolute returns increased over the 30-minute horizon for pilot stocks relative to control stocks. While the 30-minute results are mixed, the absolute return results suggest that the tick and bid tests have no effect on the magnitude of daily returns while they seem to dampen the magnitude of five minute returns. Further, the tick test seems to dampen short-term returns more than the bid test.

The return variance results in Panels A and B are quite a bit weaker. Panel A shows that the changes to return variances experienced by pilot stocks are statistically similar to the changes in return variances experienced by control stocks for both Listed Stocks and Nasdaq NM Stocks, and this result holds for all three return horizons. Panel B confirms this result for the 30 minute and daily return horizons but finds that pilot Listed Stocks seem to experience an increase in return volatility over the 5 minute horizon relative to control Listed Stocks. In summary, the bid test seems to have no effect on return variance over any time horizon while the tick test might dampen return variance over the five minute horizon.

Because the results above suggest that price restrictions may dampen transitory volatility, we next focus on variance ratios that are specifically designed to capture transitory volatility by comparing the short horizon volatility to longer horizon volatility. If no transitory volatility exists, variance ratios are designed to equal one. We examine three different variance ratios. We compare five minute variance to thirty minute variance, five minute variance to daily variance, and thirty minute variance to daily variance. Panels A and B show that the variance ratio of five to thirty minute returns increased for pilot Listed Stocks relative to control Listed Stocks. Further, Panel B shows that the change for Listed Stocks differs significantly from that of Nasdaq NM Stocks. However, none of the other variance ratios changed significantly.

Because the variance ratios relative to the daily level did not show any changes, the results on transitory volatility are somewhat weak. However, the result for Listed Stocks over the five minute horizon to thirty minute horizon still helps solidify the conclusion that the tick test dampens transitory volatility over the five-minute horizon but seems to have no effect on permanent volatility.

C. *Effect on Stock Prices*

As outlined in section III above, numerous theoretical models suggest that short selling constraints can affect equilibrium stock prices. Some of these models predict that stocks are likely to be more overpriced when short selling constraints are more binding, and when investors disagree more about the stock's true value.

Our evidence above suggests that price restrictions do constrain short selling somewhat. Thus, we are interested in testing the hypothesis suggested by these theories, that removing price restrictions will lessen overpricing. This hypothesis is not likely to hold unless the price restrictions are significant relative to other short selling constraints and our sample stocks are overpriced prior to the start of the pilot. Therefore, rejecting the hypothesis might mean that price restrictions are minor relative to other short selling constraints or that our sample stocks were not overpriced.

Table 8 reports average daily returns and average cumulative returns for pilot and control stocks in the period surrounding the beginning of the pilot. If pilot stocks are over-valued because of the price restrictions, these returns should be significantly negative for pilot stocks relative to the control stocks. Cumulative returns are normalized to zero on April 29, the trading day prior to the start of the pilot. As indicated in Panel A of Table 8, we observe for Listed

Stocks a statistically significant difference between the average returns of control and pilot stocks on May 2, the first day of the pilot. The average control stock experienced a return that exceeded the average pilot stock by about twenty-four basis points. However, we do not observe significant differences in returns on other days after the start of the pilot, nor are the cumulative returns statistically distinguishable at horizons beyond the first day. For Nasdaq NM Stocks, we observe no differences in daily or cumulative returns at or after the start of the pilot that are statistically significant at the five percent confidence level.[53] Because the Listed difference does not persist and because of a lack of a difference in Nasdaq NM Stocks, neither the tick nor the bid test appear to cause stocks to be over-valued.

Figure 1 displays the returns for the pilot and control samples over the first six months of the pilot. The figure gives the raw returns as well as the market adjusted returns. Returns in general appear to be positive over this period but are close to zero when subtracting the market return. Further, the pilot sample appears to under-perform the control sample, especially for Listed Stocks. Table 9 confirms that the six month returns of the pilot stocks appears lower than that of the control stocks. However, this result is not statistically significant. Therefore, the six month returns for the pilot sample are statistically similar to the six month returns for the control sample.

Table 9 also shows that the average alphas are negative but very close to zero. This means that when controlling for risk, the returns of the sample stock are about the same as the returns of the market portfolio. Further, the univariate results of Panel A and the regression results of Panel B show that the alphas of the pilot sample are statistically similar to the alphas of

[53] On the Nasdaq NM side, we do observe a statistically significant difference on a single day several days prior to the start of the pilot (April 26). In Table 8, we tested for statistical significance on 21 separate days in two different markets, for a total of 42 different hypothesis tests. Under the hypothesis that the pilot has no effect, we would expect random errors to cause roughly two out of the 42 tests to show false positive significance at the five percent level.

the control sample. Therefore, the pilot stocks did not underperform the control stocks. This suggests that the removal of the price restrictions will not result in either a long horizon correction of over-pricing nor is it likely to lead to prices being driven below their equilibrium value.

Table 9 also shows the tendency of the alphas to be significantly positive or significantly negative. An alpha is deemed to be negative if the estimate is significantly negative at the 5% level in a two-tailed test. Similarly, an alpha is considered to be positive if the estimate is significantly positive at the 5% level in a two-tailed test. If the alphas are completely random, we would expect to find 2.5% of them positive and 2.5% of them negative. Table 9 shows that the frequency of positive alphas is less than 2.5% while the frequency of negative alphas is slightly higher.[54] The frequency of negative alphas is statistically similar for pilot stocks and control stocks, providing further evidence against prices being driven below their equilibrium level. Among Listed Stocks, the control stocks appear to be more likely to have positive alphas, potentially because price restrictions facilitate over-pricing. This finding however, is weakened by the observation that fewer than 2.5% of control stocks have significantly positive alphas.

D. Market Manipulation

Because the type of analysis conducted in this study cannot directly prove whether market participants are engaging in manipulative practices, it is inherently difficult to measure whether the Pilot has had any impact on the degree to which markets are susceptible to manipulation. Our approach is to identify certain data patterns that we would expect to be more

[54] We also estimated the alphas using the value-weighted index. About 2.5% or fewer alphas were significantly positive and about 2.5% or fewer were significantly negative.

prevalent in a world where prices are manipulated, and investigate to see if these price patterns are more common for pilot stocks than control stocks. Such a pattern does not necessarily mean that manipulation has occurred, but indicates that we might have cause for further analysis.

As argued above in section I-B, if price restrictions inhibit manipulation by short sellers and/or facilitate upward manipulation, we might expect to see more large, sudden price declines and more price increases in pilot stocks than control stocks. If so, this should be reflected in the form of decreased skewness in the short-term returns distribution.

Table 10 reports results of statistical tests based on 5-minute, 30-minute, and 1-day returns. For each returns horizon, we follow the same approach as before and test for changes in skewness between the Pre-Pilot Period and Pilot Period, separately for pilot and control stocks, and for Listed and Nadaq stocks, and then test whether the difference of differences is significantly different from zero.

As the table indicates, we find no significant changes between the Pre-Pilot Period and Pilot Period, with the single exception that there appears to have been a marginally significant decline in the skewness of Listed pilot stocks at the 30-minute return interval. However, neither in this nor any other case do we find any statistically significant differences between pilot and control stocks. Thus, we find no evidence that the pilot program has had any impact on returns skewness. The results reported in Table 10 are based on the skewness of returns computed using trade prices.[55]

Our second approach to testing whether eliminating price restrictions may lead to an increase in price patterns indicative of market manipulation involving short sales is to examine the relative frequency of large negative and positive price reversals, as explained in section V-C,

[55] We also performed the test using returns computed using quote midpoints (results not reported) and again found no significant differences between pilot and control stocks. Using this alternative measure, the point estimates indicate an even smaller difference than indicated in Table 9.

above. Our results are presented in Table 11. Panel A reports results for return reversals occurring over subsequent 5-minute intervals, and Panel B reports results based on 30-minute intervals.

In this table, the line corresponding to "Reversal Size > 2" reports the number of times (per 100,000 observations) that a stock price move of 2 standard deviations or more was reversed in the subsequent period. So, for example, the number 338.4 in the first column of Panel A indicates that for Listed, pilot stocks, the frequency of negative five-minute reversals greater than two standard deviations in magnitude is approximately 0.003384, or 338.4 out of 100,000. In this table, statistical significance is ascertained using a nonparametric bootstrapping procedure outlined in section V-C. This test, which is applied only to the pilot sample, indicates whether the observed frequency of reversals would constitute a rare event under the null hypothesis that the distribution of reversals is the same for control and pilot stocks. Results are reported for thresholds ranging from two to nine standard deviations.

Our results in Panel A indicate that the pilot stocks tend to experience significantly more 5-minute return reversals than the control stocks, at least for thresholds in the range of two to four standard deviations. This same result is observed for Listed Stocks and Nasdaq NM Stocks. If price restrictions deter price patterns consistent with downward manipulations but not upward manipulations, we might expect to see more negative price reversals in the pilot sample than the control sample, but no difference in positive reversals. In our sample, however, the effect of the pilot appears to be equally as strong, if not stronger, for positive reversals than for negative reversals.

The results based on the 30-minute horizon, reported in Panel B, tell a different story. At the 30-minute horizon, there is no longer any statistical evidence that pilot stocks have a higher

frequency of reversals than control stocks.[56] If anything, the result is in the opposite direction—for Listed Stocks at the higher threshold levels, there appears to be some evidence that there are significantly fewer positive reversals for pilot stocks than control stocks.

As explained in Section V-D, above, our third approach to investigating whether removing price restrictions increases the prevalence of price patterns consistent with market manipulation is to use an autoregression model to estimate the extent to which positive and negative returns tend to be reversed in subsequent periods. The results of this analysis are presented in Table 12.

Panel A shows how five minute returns are correlated with the returns of each of five previous five-minute periods. A positive number reflects returns in the same direction. A negative number reflects return reversals. Most of the coefficients in Table 12 are negative, reflecting a tendency for five-minute price changes to be reversed over subsequent periods. While many of the autocorrelations changed from the Pre-Pilot to Pilot Period, we focus on how the pilot sample compares to the control sample. Over one lag, removing price restrictions makes returns in Listed Stocks more negatively autocorrelated. This is true whether the previous returns were positive or negative. The effect continues for two lags (ten minutes), but only following positive returns. Price restrictions have no effect on five-minute return autocorrelation in Nasdaq NM Stocks.

[56] Panel B of Table 11 reports results for 32 different hypothesis tests (eight different thresholds, positive and negative reversals, Listed and Nadaq samples). Of these 32 tests, only one indicates statistical significance at the five percent level (negative reversals for Listed Stocks at the 3-standard deviation threshold). Even under the null hypothesis of no true effect, we would expect any individual test to show a "false positive" at the 5% significance level approximately 5% of the time. Thus, one significant test statistic out of 32 tests does not constitute a meaningful rejection of the null hypothesis.

Panel B shows the results for thirty minute returns. Measured relative to control stocks, the pilot stocks experience no statistically significant increase in return correlation for any of the thirty minute intervals examined.

In summary, returns in Listed Stocks are negatively serially correlated following both positive and negative returns over short horizons and removing price restrictions increases this negative correlation. The symmetry of these results is consistent with the volatility results above. We find no statistically significant impact for Nasdaq NM Stocks.

E. Small and Low-Volume Stocks

The analysis presented heretofore analyzes Listed Stocks and Nasdaq NM Stocks separately, but beyond this does not make any effort to ascertain whether the pilot may have a disproportionate or qualitatively different effect on smaller or less liquid stocks. In order to address these questions, we partition the sample into deciles according to market capitalization and turnover. As described above in section V-E, we partition the sample into deciles before separating them across markets, to ensure that Listed Stocks and Nasdaq NM Stocks in the same decile are comparable. The sample sizes resulting from these decile partitions are reported in Table 13. As the table indicates, the Listed Stocks are more concentrated in the higher deciles of market capitalization, while the opposite is true for Nasdaq NM Stocks. However, both Listed and Nasdaq NM Stocks have representation across all deciles of the two measures.

Tables 14 through 26 present our results analyzing how many of the results presented earlier vary as a function of size and liquidity. As explained in section V-E, above, these tables are based on a regression analysis where each model includes a pilot indicator and a pilot indicator interacted with indicator variables for deciles one through nine. In this model, the

marginal effect of the pilot is captured through two channels, first through the pilot indicator variable, and secondly through the interacted indicator variable. To facilitate interpretation, the tables report the sum of the coefficients on the pilot dummy and the interacted terms. This way, the entries in the table show directly how the pilot sample differs from the control sample within each decile.

Table 14 shows how the tick and bid tests affect short selling volume for stocks in each size and turnover decile. Removing the rules increases short selling volume in almost every size and volume decile. Further, the tick test appears to hinder short selling slightly more in small stocks than in large stocks. The bid test, on the other hand, appears to hinder short selling slightly more in large stocks than in small stocks. The affect of the tick and bid tests appear unrelated to turnover level. According to the Nasdaq market share results in Table 15, the removal of the bid test on Nasdaq seems to increase Nasdaq's market share more for small stocks than for large stocks. Overall, the tick and bid tests do seem to have differing affects on short selling for stocks of varying sizes.

In results not reported in tables, only the tick test has a differential effect on the balance of trading in stocks of differing sizes while all other mechanical effects are similar across size and activity levels. The tick test has a bigger effect on the symmetry of trading in smaller stocks but a constant effect on the symmetry of stocks of varying activity levels.

Tables 16 and 17 show whether the augmentation of the bid and ask depth is similar for large and small stocks. These patterns are qualitatively similar in both tables. The tick test augments depth across almost all size and activity levels without clearly augmenting large or small stocks more. The bid test's influence on depth, however, varies widely across size and

activity levels without a discernable pattern. Therefore, the depth augmentation from the tick and bid tests appears unrelated to the size or activity level of the stocks.

As stated above, the increase in the depth at the inside quote affects the displayed supply of liquidity but might not influence realized liquidity, as measured by effective spreads. Table 18 shows that the tick test has no effect on effective spreads for almost all size and activity levels. The bid test, however, seems to result in lower effective spreads for large or more active stocks and potentially higher spreads for small or less active stocks. When significant, however, the magnitudes are still only a few basis points.

The results above show that transitory volatility is dampened by the tick test with much weaker evidence on the bid test. Table 19 shows that the tick test primarily dampens the volatility of small stocks but seems to amplify the volatility of large stocks. The bid test shows a similar pattern but to a lesser degree. The results across turnover levels are not as striking. The tick test seems to dampen volatility for most activity levels and the bid test shows similar yet substantially weaker evidence.

Table 20 summarizes the evidence on how the tick and bid tests affect longer-term variance. While the tick test does not affect the daily return variance in stocks as a whole, it does seem to dampen daily return variance in small stocks and increase daily return variance in large stocks. The bid test shows a similar pattern but the effect is only significant for a few of the smaller size levels. The tick and bid tests have no effect on daily return variance for any activity level.

The results above show little evidence that the tick or bid tests affect price levels. However, there is a 24 basis point return difference between pilot and control Listed Stocks on the first day of the Pilot. Table 21 summarizes whether this return difference varies by size or

activity level. The evidence shows that for most size and activity levels, the pilot and control stocks experienced a statistically similar return on the first day of the Pilot. The Listed pilot stocks had a lower return than the control stocks in the largest size group while the Nasdaq NM pilot stocks had a lower return than the control stocks in the highest turnover group. Hence, the prior results seem to be driven by the large Listed Stocks.

Table 22 compares the pilot stock six-month alphas to the control stock six-month alphas for the various size and activity groups. Like the May 2 results, the pilot alphas are statistically similar to the control alphas in every size and activity level. Therefore, the tick and bid tests do not promote or hinder pricing efficiency for any size or activity level.

Recall from Table 11 that negative and positive five-minute price reversals are more prevalent in the pilot sample than the control sample, especially for Listed Stocks. Repeating our analysis across deciles, we find the difference between pilot and control Listed Stocks is significantly more pronounced for stocks with the lowest market capitalization (results not presented). These findings are consistent with our other results indicating that smaller stocks tend to be more volatile when the tick test is removed. However, for the smallest Listed Stocks, we observe a greater number of positive than negative price spikes, suggesting that removing the tick test does not make smaller stocks unduly susceptible to negative price pressure.

VII Summary and Conclusions

The pilot program established by Regulation SHO exempted approximately one third of the Russell 3000 stocks from the "tick test" (Rule 10a-1) for Listed Stocks and the "bid test" (former NASD Rule 3350) for Nasdaq NM Stocks traded on Nasdaq or traded OTC and reported to an NASD facility. The pilot was designed to facilitate comparison between the pilot stocks

and control stocks, thus creating an unprecedented opportunity to observe in a controlled environment the effects of removing the price restrictions.

This study has compared pilot and control stocks along numerous dimensions, in an effort to capture a broad range of possible effects. Our main empirical results are as follows:

- The pilot is associated with increased short selling volume in Listed and Nasdaq NM Stocks, but appears to have no impact on the level of short interest in either market. The increase in short selling is slightly higher for small Listed Stocks than for large Listed Stocks.

- The pilot is associated with an increase in Nasdaq's share of trading volume in Nasdaq NM Stocks, suggesting that market participants are routing trades to other venues in order to avoid the bid test. The market share increases more for smaller stocks. For the largest Nasdaq NM Stocks, such as those included in the Nasdaq 100, there is no significant difference in market share.

- We find no evidence that the pilot has had any impact on the level of trading activity in the options market, as we would have expected to see if market participants are using option markets to avoid the tick test or the bid test.

- For Listed Stocks, less than 46% of all trades are executed on down bids when the tick test applies, while the number is close to 50% for pilot stocks, suggesting that Rule 10a-1 constrains the execution price in four to five percent of trades. For Nasdaq NM Stocks, Rule 3350 does not explicitly prevent trading on downticks, but our results show that it effectively constrains trading on downticks for about one half of one percent of trades.

- The pilot is associated with a decrease in quote depth, especially on the ask side for Listed Stocks—our evidence confirms that Rule 10a-1 forces some short sellers who would otherwise be liquidity demanders to act as liquidity suppliers. The decrease in depth appears unassociated with size or turnover.

- Other than the effect on market depth, the pilot has had no clear effect on market liquidity—most of our tests indicate that liquidity was not significantly impacted by the pilot, but some tests indicate small increases or decreases in liquidity, depending on the measure.

- The pilot is associated with an increase in some measures of intraday volatility. These increases appear to be confined to the smaller stocks as larger stocks experienced a decline in volatility during the pilot.

- On average across all types of stocks, the pilot does not appear to have any significant effect on daily volatility—however, our results indicate the pilot is associated with

lower volatility for stocks with higher market capitalization, and higher volatility for stocks with lower market capitalization.

- Based on the price reaction to the initiation of the pilot, we find limited evidence that the tick test distorts stock prices—on the day the pilot went into effect, Listed Stocks in the pilot sample underperformed Listed Stocks in the control sample by approximately 24 basis points. However, the pilot and control stocks had similar returns over the first six months of the pilot.

- We find no evidence of "bear raids" associated with the pilot. More specifically, we test for evidence of bear raids in three ways:

    - We test whether the pilot has affected the relative frequency of large negative vs. large positive stock returns, as reflected in the skewness of the returns distribution. There is no difference in skewness between control and pilot stocks
    - A bear raid may be associated with a large negative return that is very quickly reversed, or a "negative price spike." Although we do find a higher incidence of negative price spikes in the pilot sample at some horizons, the same thing is observed for positive price spikes.
    - We also measure directly the tendency for price movements to be reversed in subsequent periods. Again, we find that the pilot is associated with a slightly greater tendency for price changes to be reversed, but this effect is observed equally for positive and negative returns.

In summary, having examined the impact of the Regulation SHO Pilot on a wide array of market characteristics, we conclude that price restrictions constitute an economically relevant constraint on short selling. Our evidence suggests that removing price restrictions for the pilot stocks has had an effect on the mechanics of short selling, order routing decisions, displayed depth, and intraday volatility, but on balance has not had a deleterious impact on market quality or liquidity. In various dimensions, our evidence confirms that the tick test of Rule 10a-1 acts as a more binding constraint than the bid test of former NASD Rule 3350. On most dimensions, the effects of the pilot do not appear to be systematically related to market capitalization or trading volume, suggesting that our results give a reasonable picture of what we might expect to see if price restrictions were removed for all stocks, including smaller stocks and stocks less actively

traded than those in the Russell 3000. However, some results, particularly those involving volatility, suggest that the effect of the tick test and the bid test may be systematically related to market capitalization.

We conclude with a few caveats. While the Pilot study was designed to facilitate a natural experiment in a controlled environment, the results might not be entirely representative of removing the rule permanently for all stocks. It is possible that traders might behave differently if a rule were permanently and completely removed than if it is only temporarily or incompletely removed. Moreover, it is possible that traders with manipulative intentions might be on good behavior if they believe that heightened scrutiny during the Pilot increases their chances of getting caught.

Tables

Table 1: Sample characteristics

This table shows the number of sample stocks categorized by whether they are in the Pilot, their listing status, and whether they have tradable options on them. The Pilot stocks are those designated in the first Pilot Order that are trading on Amex, Nasdaq NM, or NYSE as of May 2, 2005. The Control stocks are the ones that were eligible to be selected for the Pilot but were not. The Control stocks are limited to those trading on Amex, Nasdaq NM, and NYSE as of May 2, 2005. Listed Stocks are stocks listed on NYSE or Amex. This table shows the sample sizes as of October 31, 2005 as well. To avoid survivor biases, we retain stocks in the sample even if they stocks cease trading on Amex, Nasdaq NM, or NYSE before the end of our sample period on October 31, 2005. This table shows the sample sizes as of October 31, 2005 as well. Stocks are considered optionable if they have traded options at some point in the four months prior to the start of the Pilot. Short-term options are options with experations within one year.,

Variable	Listed Stocks		Nasdaq Stocks	
	Pilot	Control	Pilot	Control
# Stocks (first day of the Pilot)	504	973	439	917
# Stocks (last day of the Sample Period)	496	949	423	877
# Optionable Stocks (all options)	350	690	278	573
	(69.44%)	(70.77%)	(63.33%)	(62.28%)
# Optionable Stocks (short-term options)	350	688	277	567
	(69.44%)	(70.56%)	(63.10%)	(61.63%)

Table 2: Comparison of Pilot and Control Stocks Before Initiation of Pilot

This table compares the Pilot and Control stocks in several statistics over the four month period prior to the start of the Pilot on May 2, 2005. The statistical difference between the samples is tested using a two-sample t-test. * and ** indicates that the Pilot stocks are statistically different from the Control stocks at the 5% and 1% levels in a two-tailed test.

Variable	Listed Stocks		Nasdaq Stocks

Table 3: Changes in Short Selling Activity

This table summarizes how short selling changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" and the six months following the start date are called the "Pilot". The table shows the average change in short selling for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Short Volume is the number of shares in short sale transactions divided by total share volume. Short Trades is the number of short sale transactions divided by total transactions. Short Interest is the monthly short interest times 100 divided by the shares outstanding. Days to Cover is the monthly short interest divided by the average daily share volume during the corresponding month. Nasdaq market share is Nasdaq's share of the volume of short selling. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the Difference in the Change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 4: Changes in Option Trading

This table summarizes how option trading and open interest changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" and the six months following the start date are called the "Pilot". The table shows the average change in option trading and open interest for Pilot and Control stocks and estimates whether the Pilot stocks changed more than the Control stocks. Panel A reports statistics on all options. Panel B reports statistics on short-term options. The data includes securities that had put and call option volume in both the Pre-Pilot and Pilot periods. There were a total of 690 Control stocks and 350 Pilot stocks included in the Listed sample and 573 Control stocks and 278 Pilot stocks in the Nasdaq sample. Open interest and volume are adjusted for stock splits. New option listings after May 1, 2005 were excluded from the analysis. The data source for the options data is the Options Price Reporting Authority (OPRA). Short-term options are identified using the Options Clearing Corporation directory. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We also test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using two sample t-tests. [a, b] indicates that the difference for Nasdaq NM Stocks is statistically different from the difference for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 5: Changes in Trading and Quoting Mechanics

This table summarizes how trading and quoting mechanics change when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" Period. The table shows the average change in the number of down ticks and the percent of time on a down bid for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for Pilot Securities and the variable's pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the Pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 7: Volatility

This table summarizes how volatility changes when the tick and bid tests are removed. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The table shows the average change in various volatility measures for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Daily Price Range is 100*(log high – log low). Absolute return and standard deviation are reported in percentage points. While standard deviation is reported, tests were run on variances to avoid Jensen's inequality. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test. We test whether the difference in the change for Listed Stocks is statistically different from that of Nasdaq NM Stocks using a regression framework. During the Pilot Period, we run daily cross-sectional regressions of each variable on an indicator for pilot securities and the variable's Pre-Pilot level (equation 1). We run the regression separately for Listed and Nasdaq NM Stocks and test whether the coefficients on the pilot indicator are similar. [a, b] indicates that the average coefficient for Nasdaq NM Stocks is statistically different from the average coefficient for Listed Stocks at the 1% and 5% level in a two-tailed test.

Table 8: Returns around the May 2, 2005 Start of the Pilot

This table shows the returns surrounding the May 2 initiation of the pilot. The raw returns are equally-weighted averages of the returns for each stocks, as collected from CRSP. The Cumulative Returns are set to be zero on the day prior to the start of the pilot. The Cumulative returns represent the compounded returns on an investment made at the April 29 closing price. * indicates that the control stock returns are statistically different from the pilot stock returns at the 5% significance level in a two-tailed test. None of the returns are statistically different at the 1% level.

Table 9: Six Month Returns

The table summarizes tests of whether the six month returns of the pilot stocks differ from the six month returns of the control stocks. The raw returns are compounded cumulative returns from CRSP. If a stock is not in the sample for the entire six months, its return from its last day is compounded to six months. The market adjusted returns is simply the raw return minus the CRSP equally-weighted index. The alpha is estimated in-sample by regressing the raw return for a stock on the equally-weighted CRSP index return. A stock's alpha is considered "negative" if it is statistically below zero at the 5% level in a two-tailed test. Likewise, a stock's alpha is considered "positive" if it is statistically above zero at the 5% level in a two-tailed test. ** indicates that the control stock returns are statistically different from the pilot stock returns at the 5% significance level in a two-tailed test.

Panel A: Univariate Differences

Variable	Market	Pilot	Control	Difference
Raw Return	Listed	9.18%	11.56%	-2.38%
Raw Return	Nasdaq	14.21%	16.30%	-2.09%

Table 10: Skewness

This table summarizes how skewness changes when the tick and bid tests are removed. The four months prior to the pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The table shows the average levels and changes in various skewness measures for pilot and control stocks and estimates whether the pilot stocks changed more than the control stocks. Sample skewness is computed for each stock in the pilot and contol sample in the Pre-Pilot and Pilot period, for five-minute, thirty-minute, and one day return intervals. Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1% and 5% level in a two-tailed test.

		Pilot Sample			Control Sample			Pilot Δ minus

Table 11: Extreme Price Reversals

This table summarizes how the frequency of large negative and positive short-horizon price reversals differs across pilot and control stocks. The numbers in the table represent the number of reversals per 100,000 stock/intervals. A negative (positive) reversal is defined as a negative (positive) return immediately followed by a positive (negative) return. The "size" of the reversal is defined as the minimum absolute value of the two adjacent returns, normalized by the pre-pilot standard deviation of the stock's holding-period return, where the second return is computed as a percentage of the lagged price, and the holding period is five minutes or thirty minutes. The frequency of reversals is computed based on a six-month period following the pilot start date (May 2, 2005). The pre-pilot standard deviation used to normalize the returns is computed over a four-month period prior to the start date. Nonparametric statistical tests based on a bootstrapping procedure determine whether the number of reversals observed in the pilot sample would be statistically rare in the control sample. **, * indicates statistical significance at the 1% and 5% level in a two-tailed test.

Panel A: Five-Minute Return Reversals

	Listed Stocks				Nasdaq Stocks			
	Negative Reversals		Positive Reversals		Negative Reversals		Positive Reversals

Table 12: Semi-Autoregression Results

This table reports average regression coefficients of returns on lagged positive and negative component returns, for pilot and control stocks before and after the start of the pilot. The four months prior to the Pilot start date (May 2, 2005) are called the "Pre-Pilot" period and the six months following the start date are called the "Pilot" period. The coefficients reported in the table are the mean coefficients across all stocks in the subsample, estimated over the designated period, of the autoregressive model:

$$R_t = \sum_{n=1}^{5} \alpha_n R_{t-n}^{-} + \sum_{n=1}^{5} \beta_n R_{t-n}^{+} .$$

where R_t represents the stock return in period t, and

$$R_t^{-} = \min(0, R_t) \qquad R_t^{+} = \max(0, R_t) .$$

Paired t-tests determine whether the changes are significant. Tests of the difference between the changes are two-sample t-tests. **, * indicates statistical significance at the 1 and 5% level in a two-tailed test.

Table 13: Sample Deciles

This table shows the number of stocks in each market capitalization, turnover, and short selling decile. The deciles are set so that each decile contains the same number of stocks for the full sample. This table reports the subsample sizes separately for pilot and control stocks and for Listed and Nasdaq NM Stocks. It also gives the proportion of stocks in that decile and market that are pilot or control stocks.

	Listed				Nasdaq			
	Pilot		Control		Pilot		Control	
	Count	Proportion	Count	Proportion	Count	Proportion	Count	Proportion
	Market Capitalization							
Decile								
Lowest	22	33.9	43	66.1	62	28.4	156	71.6

Table 14: Changes in Short Selling Activity Across Market Cap and Turnover Deciles

This table shows the marginal effect of the pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Short Selling Volume}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10} \text{Pilot}_i + \beta_{11} \text{Pre Short Selling Volume}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the number of shares sold short on a day divided by the total volume on that day. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. **,* indicates that the effect is statistically different from zero at the 1 and 5% level in a two-tailed test.

	Market Capitalization		Turnover	
	Listed	Nasdaq	Listed	Nasdaq
Decile				
Lowest	-0.26	-1.55**	2.84**	1.44**
2	4.83**	1.68**	2.84**	1.17**

Average R^2	0.10	0.09	0.10	0.09

Table 15: Changes in Nasdaq Market Share Across Market Cap and Turnover Deciles

This table shows the marginal effect of the Pilot derived from the coefficients from the following daily cross-sectional regressions:

$$\text{Nasdaq Market Share}_i = \alpha + \sum_{k=1}^{9} \beta_k \text{Pilot}_i \times \text{Decile}_{ki} + \beta_{10}\text{Pilot}_i + \beta_{11}\text{Pre Nasdaq Market Share}_i$$

Reported is the average sum of $\beta_{10} + \beta_k$. The dependent variable is the Nasdaq share of short selling volume on a day. The regressions are estimated on each day during the Pilot Period. The statistical significance of the coefficients is determined by the distribution of the coefficients. We divide the stocks into deciles by market cap on May 2, 2005 and by the pre-Pilot turnover where decile 1 contains the smallest stocks and lowest turnover stocks. ** indicates that the effect is statistically different from zero at the 1 % level in a two-tailed test.

	Market Capitalization		Turnover

Appendix A: Concurrent Regulation SHO Pilot Studies

We have identified three concurrent studies that also examine the effect of removing the tick test and/or the bid test during the Regulation SHO Pilot. See the attached chart for a simplified comparison of the studies. Much of the analysis is similar to the analysis reported in this report, but the construction of the samples differs in important ways. Each approach has its merits. The main difference between the construction of the samples for this report and the sample construction in the concurrent papers is the incorporation of stocks that might be outliers. This report includes these stocks because they might be the ones most affected by the Pilot. The other studies exclude these stocks in order to improve matching between the pilot and control stocks or to remove the influence of confounding events. Despite the different decisions, many of the results of this report are supported by the results of the concurrent studies.

Findings				
Short Selling	Higher relative short sale volume. NYSE: higher number of short sale trades No impact on the number of NASDAQ short sale trades.	No significant impact on short sale volume for either NYSE or NASDAQ. NYSE: Pilot stocks had a higher number of short sales trades and a lower average short sale trade size. NASDAQ: No impact on number of short sales trades or average short sale trade size.	Examines only short selling on the NYSE Relative short selling increases for pilot stocks. Significant for small stocks but not large stocks.	Higher short sale volume and a higher number of short sale trades. No impact on short interest or days to cover. No impact on option trading volume or open interest. Trading is more balanced for pilot stocks. The increase in short selling is bigger for small stocks.

Study	Diether, Lee, and Werner (2006)	Alexander and Peterson (2006)	Wu (2006)	SEC
Liquidity	No impact on NASDAQ stocks. NYSE: Larger quoted, effective, and realized spreads, smaller quoted ask depth, higher relative bid depth, smaller buy imbalances.	NYSE: larger spreads, smaller quoted ask depth, smaller quoted bid depth, higher price impact NASDAQ: larger spreads No effect on effective spreads	Relative effective and quoted spreads increase with pilot by < 1 bps. This is statistically significant only for small stocks. Smaller buy imbalances across all market cap groups. Offer depth declines for most size groups.	Listed: smaller quoted ask depth in univariate and regression. Regression shows decrease in both bid and ask. Some tests show small increases or decreases in realized liquidity.
Volatility	No increase in the majority of the 26 different volatility measures for Pilot Stocks. NYSE: higher short term volatility (15/5 variance ratio), daily return volatility, trade to trade return volatility, offer to offer quote volatility, five-minute bid and offer volatility, daily up-side and down-side semi-variance. The authors examine semi-variance, trade returns, bid quote returns, and ask quote returns for various time lengths: trade to trade, quote to quote, five-minute, fifteen-minute, and daily. They also examine the 15/5 minute variance ratio.	No impact. The authors examine six volatility measures: 5 minute return volatility, semi-variance, daily relative price range, Fama-Franch three-factor model idiosyncratic risk, CAPM idiosyncratic risk, and implied volatility.	Variance ratios did not change with pilot. Daily price range and intraday price standard deviation do not change.	Some evidence of an increase in intraday volatility. This appears to be driven by smaller stocks as larger stocks saw a decline in intraday volatility during the pilot. While average daily volatility does not change, smaller stocks experienced lower volatility during the pilot as larger stocks experienced an increase.

SEC_OEA_FCIC_001721

Study	Diether, Lee, and Werner (2006)	Alexander and Peterson (2006)	Wu (2006)	SEC
Efficiency		No impact except for the following measures for NYSE stocks: higher autocorrelation of five-minute returns, greater likelihood of a lower price for the second trade after a short sale, and greater likelihood of a higher trade price for the first trade after a short sale. The authors examine the autocorrelation of five- and thirty-minute returns, upside minus downside r-squared, and price runs.	Hasbrouck pricing errors show no significant change with pilot. Intraday return autocorrelations (30 and 60 minute) did not change with pilot.	Higher five-minute return reversals. Higher five-minute semi-autoregression. No impact on thirty-minute return reversals, thirty-minute semi-autocorrelation, or on skewness in five-minute, thirty-minute, and daily returns.
Returns		No significant impact on returns surrounding the announcement date of the Pilot stocks, on the initiation day of the Pilot, or during the first month of the Pilot.		Listed pilot stocks had a 24 bps lower return than control stocks on the initiation day of the Pilot but had statistically similar cumulative return during the 6 months after the Pilot.
Conclusion	While the suspension of the NYSE tick test is found to be associated with larger spreads and higher short-term volatility, this evidence is consistent with the distorting effects of the tick test on short sellers (i.e., forcing them to be liquidity suppliers) rather than any benefit to investor welfare.	Concerns about the removal of the price tests leading to a degradation of market quality are unfounded. Price tests do not further the stated objectives of short sale regulation.	Tick test reduces short selling and narrows the spread primarily for small stocks. Tick test does not seriously constrain short sellers from trading on their information.	Most evidence shows that the pilot had a minor effect. The most intriguing results are in volatility. Some evidence that the tick test has a bigger effect in small stocks.

OFFICE OF ECONOMIC ANALYSIS
MEMORANDUM

To: Chairman Christopher Cox

Through: James Overdahl

From: Daniel Aromi and Cecilia Caglio

Date: December 16, 2008

Re: Analysis of Short Selling Activity during the First Weeks of September 2008

This memo is written in response to questions posed by you and the other commissioners concerning the nature of short selling in the volatile period in early September 2008 that prompted the Commission to approve several emergency orders, many of which were aimed at curbing the potential for short selling to drive prices down. The main objective is to examine the extent to which short selling appeared to drive prices downward during this period.[1] To this end, this memo seeks to establish if, at an intraday level, there exists an association between measures of short selling activity and stock returns. In particular, we would like to document whether periods of negative returns are associated with unusually high short selling activity.

There are different reasons why investors and intermediaries short sell stocks. These include liquidity provision and speculative trading. Further, as is the case with other buys and sells, short-selling can also be used to "front run" other investors or manipulate prices. Depending on their motives, some short sellers might be contrarian traders, short-selling during periods of positive returns, while others might be momentum traders. In addition they might differ in terms of the price aggressiveness of the orders submitted with its resulting price pressure. The impact of measures that restrict short sales depends on how different short sellers are affected by the restrictions. For example, restricting short sales that provide liquidity or react to price overreaction might result in higher transaction costs and higher volatility.

Our results are inconsistent with the notion that, on a regular basis, episodes of extreme negative returns are the result of short selling activity. On average, short sale volume as a fraction of total volume is higher for periods of positive returns than for periods of negative returns. In addition, the average price aggressiveness of sellers who own the stock is higher than what is observed for short sellers. Our analysis is based on average behavior, we can not rule out the possibility that there might exist some instances in which short selling activity peaked during a period of extreme negative returns.

Short sale volume as a fraction of total volume is higher for periods of positive returns than for periods of negative returns. We find the same results when we compare extremely low and extremely high return periods. In addition, the average volume of short sales is generally not significantly higher for periods of negative returns when compared to periods of positive returns.

[1] Note that this analysis does not test for a causal relationship between short selling and stock prices or returns, but it can provide statistics that are consistent or inconsistent with such a causal relationship.

SEC_OEA_FCIC_001723

The analysis of the price pressure emphasizes the role of short sellers during extreme market movements. In general, during periods of extreme negative returns, the sell pressure is more intense for long trades indicating that short sales put less pressure on prices than other sales during periods of extreme negative returns. During periods of extreme positive returns, we observe buy pressure, both for trades involving short sales and long trades. However, the selling pressure for other sales is higher than short selling pressure.

Data Selection and Methodology

Our study covers the 13-day period preceding the short selling ban imposed on September 19th 2008 because this is a period during which many observers were concerned that short sellers were driving prices down.

Even though our analysis period does not extend to the period when the short selling ban applied, we study both stocks that were ultimately subject to the short selling ban and stocks that were never subject to the ban. Presumably, the stocks subject to the ban were the ones that were more likely to be targeted by short sellers. Therefore, comparing these stocks to a set of other stocks allows for an analysis of whether short sellers did indeed behave differently in these stocks.

To more efficiently handle the computing demands of this analysis, we selected a subsample of stocks subject to the ban ("banned stocks") and a comparable subsample of stocks that were not subject to the ban ("control stocks"). We selected the firms from the original group of banned stocks based on the following selection criteria. We separate the 799 ban stocks into four groups by size[2]: top 50, and divide the remaining into thirds. We select randomly firms from each of the bottom three groups, and select all from the top group, to get a total of 196 firms.

Using the same size cutoffs that were used to select the banned stocks group, we randomly select the control sample from the entire population of stocks that were not subject to the ban. The final sample includes 394 firms, 196 in the banned sample and 198 in the control sample. We retain the information on the size groupings so that we can divide our two samples into subsamples by size.

We used intraday quote and trade data from TAQ to estimate stock volume, and intraday returns, data from the Center for Research in Securities Prices (CRSP) to estimate market capitalization, and SRO data to estimate short selling levels.

Description of short selling activity and return levels

The first part of our analysis examines the relation between short selling and returns. To capture short term price movements, we focus on five minute intervals. For each stock included in out

[2] We use the market capitalization as of December 2007 to create size groups; out of 799 only 781 firms had available data.

SEC_OEA_FCIC_001724

analysis, we compute the return, short selling volume, and total volume over each five minute interval during regular trading hours. We then estimate a short sale ratio for this interval, which is the ratio between short sale volume and total volume. Because every trade has a sell side, this ratio can be used to compare the prevalence of short sales relative to other sales.

The figure 1 shows the average short sale ratio for different five-minute return levels. Results are presented for the ban/control samples and four different levels of market capitalization.

The results show that, for high market capitalization and low market capitalization stocks, the short sale ratio is lower during periods with negative returns. In other words, there is less price reaction when a sale is a short sale instead of a long sale. Holding the absolute level of returns constant, the short sale ratio is lower for periods with negative returns. This is particularly noticeable for periods in which returns are extremely low or high. For example, Figure 1 shows that for large market capitalization ban stocks the average short sale ratio for five-minute returns lower than -225 basis points is approximately 0.28. This is approximately 17% (0.05) below the short sale ratio for the periods in which the return was above 225 basis points. Out of the eight groups of stocks, the group of banned low market capitalization stocks is the only one in which average short sale ratios are higher for negative return periods.

In addition to the high/low return level comparison, we observe that there is non monotonic relationship between volatility and the short sale ratio. Periods of low volatility, with return levels between -25 and 25 basis points, are characterized by low short sale ratios. For high and medium market capitalization stocks, short sale ratios increase from low volatility periods to intermediate volatility levels, that is, periods of moderately positive or negative return. Then, as we move from intermediate to extreme return levels, short sale ratios decrease.

To find out whether a similar pattern holds for lower frequencies, we also computed returns and average short sale ratios for 30 minute periods. The computed statistics are shown on figure 2. Our previous conclusions are strengthened by the 30 minute statistics. For every subgroup of stocks we find that the short sale ratio is, on average, lower for negative return periods.

This is an analysis of average levels of short selling activity. It shows that intraday short-selling activity is not consistent with the idea that, on average, extreme negative returns are the result of short-selling activity. We do not rule out the possibility that there might be some instances in which short-selling activity did increase during a period of extreme negative returns. But it is clear that a substantial fraction of short sale volume is not associated with negative returns; and this suggests that short selling is not merely a tool for driving prices down.

Analysis of short selling activity during extreme return periods

A. Short-selling volume

In this section we compare measures of short-selling activity for periods of extremely low and extremely high returns. The focus on extreme return periods is justified since the concern about short sales is centered on volatility. For each stock we calculate the standard deviation of five minute returns for the analysis period. A five minute period is classified as a period of extreme negative returns if the return for that period is lower than -2 times the standard deviation

calculated for that stock. A five minute period is classified as a period of extreme positive returns if the return for that period is higher than 2 times the standard deviation calculated for that stock.

For this analysis, we focus only on the periods of extreme returns and estimate the average short sale ratio, short sale volume and total volume across extreme positive return periods and extreme negative return periods for each size group in our sample. The number of periods with extremely high and extremely low returns is similar and accounts for approximately 1% to 2.5% of the total number of periods.

The statistics are shown in Table 1. We find that the short sale ratio is mostly higher during periods of positive returns than during periods of negative returns. In other words, higher intensity of short selling is associated with higher returns. For "control" stocks, the average short sale ratio is significantly higher in extremely positive return periods than in extremely negative return periods for all size groups. For stocks in the ban the average short sale ratio in positive return periods is higher than in negative return periods for the top three size groups. But it is significantly higher only for the group with the largest market capitalization.

These tests confirm our previous observation that short-selling activity is higher in periods with positive returns, but these results focus specifically on extreme returns. We find that for all but one subgroup, short selling is higher during periods of extremely positive returns than in periods of extreme negative returns. In addition, the difference is significant for many of the size groups, especially for control stocks.

These findings indicate that, on average, short seller's intraday activity is contrarian. On average, short sales seem to decrease intraday volatility by selling relatively more during periods of positive returns.

The difference between the stocks subject to the ban and control stocks is noteworthy, especially as we consider smaller stocks. In particular, the association between relatively higher short selling ratios for positive return periods versus negative return periods is weaker for stocks in the ban than for control stocks. This difference deserves further investigation. For example, this might be an indication of a different mix of short sale motives for the two groups of stocks. A partition of short sale activity by motive is beyond the scope of this memo and might be unattainable without information on investor level holdings information.

Additionally, we checked the robustness of our results by running the tests in various ways, but none of these changes affect the results. These preliminary analyses are not reported on the table. For example, we considered different criteria for classifying extreme return. Instead of using a threshold of 2 times the standard deviation we also considered 1 time the standard deviation and 3 times the standard deviation. In addition, we studied short-selling activity and returns for 30 minute periods instead of 5 minute periods.

We also studied short-selling activity before and after periods of extreme returns. We found that short-selling activity is significantly higher after extremely positive returns than after extremely negative returns. This is consistent with the idea that an important fraction of short sellers are contrarian traders and benefit from short term price overreaction. We do not find any significant differences in short-selling ratios for periods that precede extremely negative and extremely

SEC_OEA_FCIC_001726

positive returns. This is not consistent with the idea that short sales cause extreme negative returns.

B. Price Pressure

In this section, we compare the price aggressiveness of trades involving short sales to trades that do not involve short sales, dividing the stocks into four groups by size, extreme return, and inclusion in the short selling ban.

In order to identify and separate long trades from short sales trades, we merge the short-selling transaction data with the dataset of all transactions and then assign the prevailing BBO to each trade.[3]

To measure the degree that short sales put pressure on prices, we compute a measure of price pressure, or price aggressiveness, for each five-minute period. We define this measure for short sales as the difference between short sale volume executed above the quote mid-point and short sale volume executed below the quote mid-point divided by total short sale volume. A number below zero would indicate that short sellers tend to demand liquidity while a number above zero would indicate that short sellers tend to supply liquidity. The lower the measure of price aggressiveness, the more the traders tend to be liquidity demanders, who can apply more price pressure than liquidity suppliers. We estimate a similar measure for trade volume that does not involve a short sale. We report these measures in Table 2.

We observe that during intervals of extreme negative returns, the price pressure is negative indicating that executed sell orders in general demand liquidity during periods of extreme negative returns. Interestingly, the measure of price pressure is less negative for short sales than for other sales, suggesting that short sales put less pressure on prices than other sales during periods of extreme negative returns. The results are statistically significant for large and mid capitalization stocks. We observe buy pressure, both for short sales and other sales, during periods of extreme positive returns. For large stocks, the buy pressure is statistically higher for short sales than for other sales (0.23 versus 0.08 and 0.21 versus 0.10 for banned and control stocks, respectively). This result indicates that all sellers are liquidity suppliers during periods of increasing prices and that short sellers are more likely to be supplying liquidity than long sellers.

When we compare the price pressure for banned and control stocks, short sales are more likely to be liquidity suppliers in banned stocks than in control stocks. This is particularly true in the case of negative market movements: short sale price pressure is negative, but is less negative for banned stocks compared to control stocks (for brevity, the statistical significance tests are not reported on the table). This evidence is not consistent with stories that short sellers exerted more price pressure in financial stocks than in other stocks during this time period.

[3] We match TAQ trade data with the short sale dataset provided by the market centers by four conditions: same symbol; same market center; same trading price; same timestamp. We exclude trades and quotes that have a code indicating an error or a correction, or a nonstandard settlement. We were able to match about 92% of the short selling trades.

SEC_OEA_FCIC_001727

We also analyzed short-selling price pressure after periods of extreme returns. These analyses are reported on Table 3. We found that after extreme negative return intervals, the short sale price pressure is positive and statistically different from the price pressure for other sales. This result supports the idea that short sellers are not demanding liquidity after prices decline. We also notice that the short-selling price pressure is positive after periods of extreme positive returns, while for other sales the negative price pressure indicates a sell pressure. The results support the intuition from the previous section that, in aggregate, short sellers act as contrarians.

SEC_OEA_FCIC_001728

Figure 1:

Short selling ratio and return levels – Five minute periods

The figures correspond to a sample of "ban" and "control" stocks as determined by the September 18 emergency order. The data corresponds to the first 13 trading days of September (09/02/2008-09/18/2008).

Short selling ratio for each five minute period is calculated by dividing the short sale volume by total volume for each stock. A stock is classified as large cap if the market capitalization on December 31 2007 is above $12.4 billions. Mid cap stocks are those with market capitalization between $12.4 billions and $440millions. Stocks are classified as small cap if the market capitalization on December 31 2007 is below $440 millions.

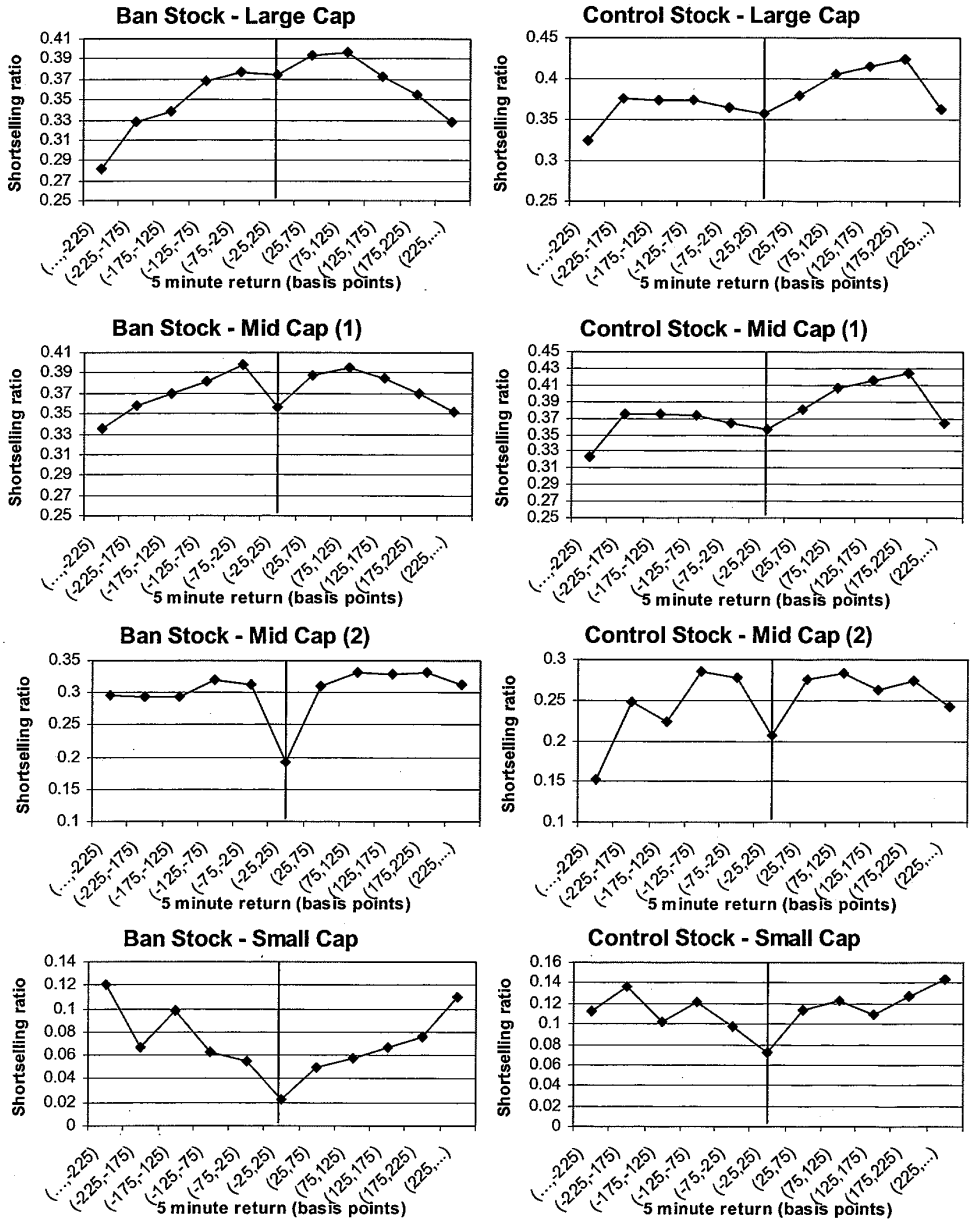

Figure 2:
Short selling ratio and return levels – 30 minute periods

The figures correspond to a sample of "ban" and "control" stocks as determined by the September 18 emergency order. The data corresponds to the first 13 trading days of September (09/02/2008-09/18/2008).
Short selling ratio for each 30 minute period is calculated by dividing the short sale volume by total volume for each stock. A stock is classified as large cap if the market capitalization on December 31 2007 is above $12.4 billions. Mid cap stocks are those with market capitalization between $12.4 billions and $440millions. Stocks are classified as small cap if the market capitalization on December 31 2007 is below $440 millions. Statistical significance of the differences are indicated by * for significance at the 10% level, ** for significance at the 5% level and *** for significance at the 1% level.

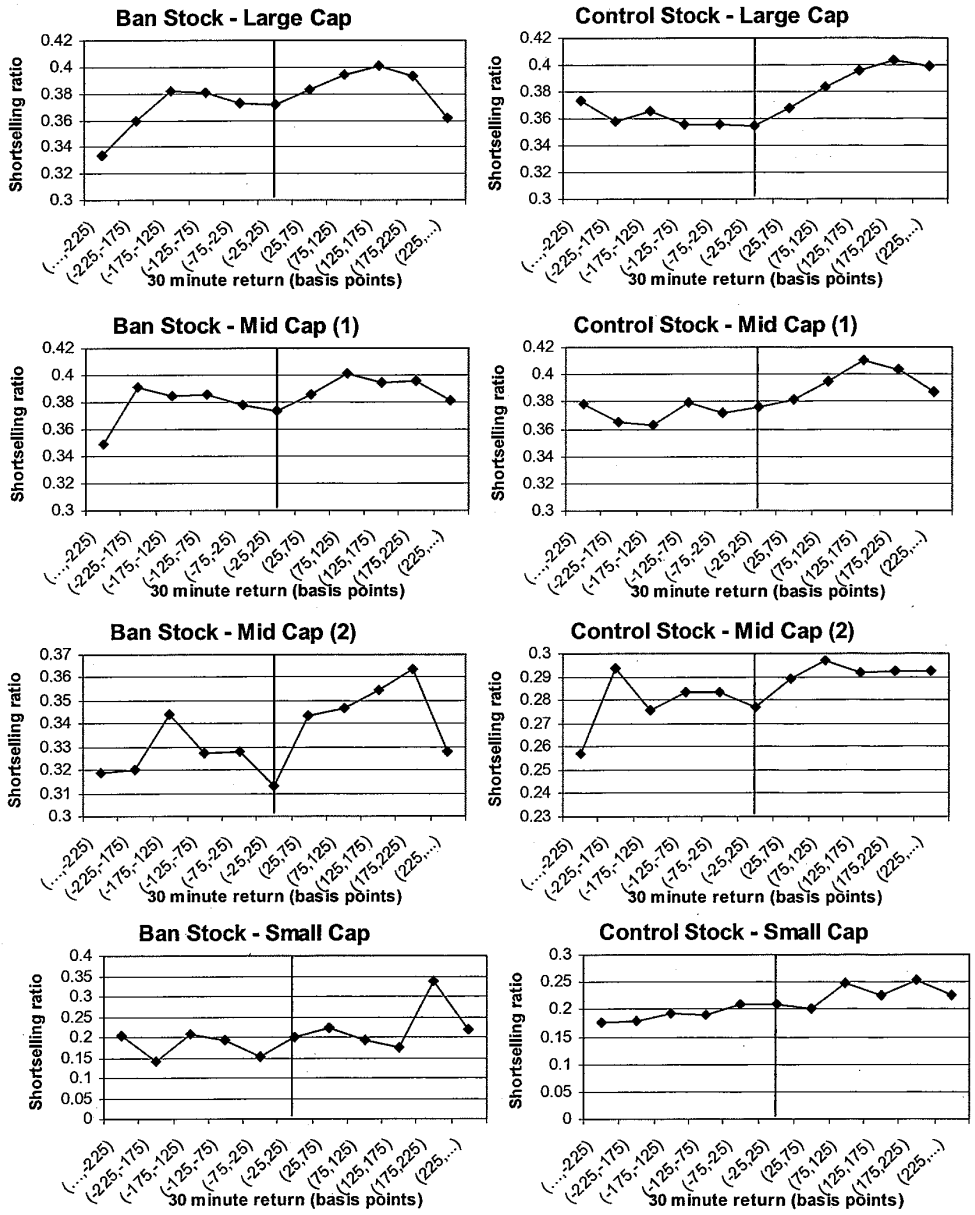

Table 1
Returns, volume and short sales

A five minute period is classified as a low return period of the corresponding return is below -2 times the standard deviation of the five minute return for that stock for the sample trading days. A five minute period is classified as a high return period of the corresponding return is above 2 times the standard deviation of the five minute return for that stock for the sample trading days. The data corresponds to a sample of "ban" and "control" stocks as determined by the September 18 emergency order. It covers the first 13 trading days of September (09/02/2008-09/18/2008). Short sale ratio for each 5 minute period is calculated by dividing the short sale volume by total volume for each stock. A stock is classified as large cap if the market capitalization on December 31 2007 is above $12.4 billions. Mid cap (1) stocks are those with market capitalization between $12.4 billions and $440millions. Mid cap (2) stocks are those with market capitalization between $440 millions and $102millions. Stocks are classified as small cap if the market capitalization on December 31 2007 is below $102 millions. Statistical significance of the differences are indicated by * for significance at the 10% level, ** for significance at the 5% level and *** for significance at the 1% level.

Short sale ratio

Stock group	Return level		Difference

Table 2
Returns and price pressure

This table shows the results for contemporaneous price pressure order imbalance in the five minute interval after an extreme positive/negative return interval. A five minute period is classified as a low return period of the corresponding return is below -2 times the standard deviation of the five minute return for that stock for the sample trading days. A five minute period is classified as a high return period of the corresponding return is above 2 times the standard deviation of the five minute return for that stock for the sample trading days. The data corresponds to a sample of "ban" and "control" stocks as determined by the September 18 emergency order. It covers the first 13 trading days of September (09/02/2008-09/18/2008). The price pressure order imbalance for each five minute interval is calculated by dividing the difference between the buyer- and seller- initiated trade volume by total trading volume within each five minute interval. A higher or less negative number suggests less price pressure. A stock is classified as large cap if the market capitalization on December 31 2007 is above $12.4 billion. Mid cap (1) stocks are those with market capitalization between $12.4 billion and $440million. Mid cap (2) stocks are those with market capitalization between $440 million and $102million. Stocks are classified as small cap if the market capitalization on December 31 2007 is below $102 million. Statistical significance of the differences are indicated by * for significance at the 10% level, ** for significance at the 5% level and *** for significance at the 1% level.

OFFICE OF ECONOMIC ANALYSIS
MEMORANDUM

To: Chairman Christopher Cox

Through: James Overdahl

From: Daniel Aromi and Cecilia Caglio

Date: December 17, 2008

Re: Analysis of a short sale price test using intraday quote and trade data.

You have asked us to summarize the previous work of our office concerning the uptick rule and variants of it for purposes of responding to Congressional inquiries on these subjects. This memo reports a series of analyses aimed at understanding how restrictive a short sale price test rule structured in a similar manner to that described in the attached document produced for discussion purposes (see specifically the section on "Liquidity Add Plus Penny Uptick") would be. For this purpose, we used consolidated intraday quote and trade data corresponding to six trading days during the month of September 2008. During this high volatility period, we examined how the short selling restrictions from a "liquidity add plus uptick" rule vary for stocks with different characteristics, for different price increments in the rule ("bid increments"), and for different market conditions.

We conducted three analyses, each designed to gauge different aspects of the potential restriction. First, we examined whether the short sales executed during this period were executed at prices allowed by the rule. Next, we examined how often the rule would force short sellers to wait behind an order book because their short sales cannot be priced below the best ask price. Finally, we simulated the submission of short sales to study how such a rule would affect execution rates and times to execution of short sale orders.

Our findings from each of these analyses indicate that the restrictions imposed by a "liquidity add plus uptick" rule depend on the number of bid increments, market conditions and stock characteristics. A short sale price test would be more restrictive for lower priced stocks and more active stocks. Counter to the intent of such a rule, we also found that a short sale price test would be most restrictive during periods with little volatility. The rule would be less restrictive on short sale orders during periods of large positive returns and large negative returns, though the restrictions are greater in rapidly declining markets compared to rapidly advancing markets.

Finally, our analyses showed that even moderate changes in bid increments can have a big impact on the constraints imposed on short selling activity. Short selling activity was deeply constrained in actively traded stocks even for low values of the bid increment (such as one to three cents) because these stocks were characterized by narrow bid ask spreads. For example, we found that for lower-priced stocks in the actively traded category, a bid increment of three

SEC_OEA_FCIC_001734

cents would restrict short sales to prices above the best ask 99% of the time. This means that short sellers would need to place orders at prices above the ask resulting in lower execution rates and longer time to execution. For the same group of stocks, for periods of moderate volatility, a three cent bid increment level results in less than 20% of our simulated orders being executed. With a one-cent bid increment, the execution rate would be approximately 60%. These statistics suggest that, for practical purposes, high bid increments, such as five or ten cents, might be equivalent to a ban on short selling in some stocks, especially during periods when prices are not changing rapidly.

ANALYSIS

Proposed Tests

A short sale price test would limit the prices at which short sales could be submitted. For a given stock, the impact of such a rule is a function of market characteristics such as bid ask spreads, arrival rate of incoming orders and volatility in the price of the stock.

For stocks with narrow bid ask spreads, or for short selling rules requiring multiple price increments, a short sale price test might require short sale orders to be placed only at prices that are higher than the best ask. This means that the order will be standing in line behind better priced sell orders. Trading centers have established policies that are designed to prevent an order from executing before any standing order with higher price priority or any standing order with equal price but higher time priority. In periods of low volatility or low arrival rate of incoming orders the execution rate of sell orders submitted at prices that are higher than the best ask can be very low.

Reg NMS established that orders placed at the best ask and best bid in each exchange are protected orders. This means that SROs implement procedures that prevent the execution of trades at a price that is inferior to the best bid or offer displayed by another market center at the time of execution. This means that a short sale order cannot be executed before any better priced sell orders displayed at the best ask of any exchange. These observations call attention to the ways in which a short sale price test restricts the submission and the execution rate of short sale orders.

The objective of this memo is to assess restrictions that would be imposed by a short sale price test rule. We use historical data to determine the impact of such a rule.

A short sale price test rule would effectively create a "minimum shortable price" (MSP) below which no short sale orders can be priced. The MSP from a "liquidity add plus uptick" rule would satisfy the following two restrictions:

(1) *Greater Than Best Bid* – at least *n* cents above the national best bid.
(2) *Greater Than Last Different Tick* –at least *1* cent above the last trade reported to the consolidated tape, or the last sale price if it was higher than the last different price (*i.e.*, a zero-plus tick).

SEC_OEA_FCIC_001735

In our analyses, (described in further detail below), we build a hypothetical MSP from past order book data. This price is a function of the quoting and trading activity as well as the price increment of the short sale price test. We also calculate a "best ask price" using data from consolidated quotes.

We propose three tests that would analyze the impact of a short sale price test. The first test, estimates the fraction of short sale trades that would occur with a price below the MSP (*MSP vs. price of short sales*). A low proportion of trades occurring at prices below the MSP threshold would be an indication that the short sale price test is not significantly restrictive. In other words, the rule would be unlikely to delay the execution of short sales if most of the short sales are already executed at high enough prices.

The second test computes the fraction of the day in which the MSP was above, equal to or below the "best ask price" (*MSP vs. Best Ask*). According to the short sale price test, if the MSP was above the "best ask price" no order can be placed at or below the best ask.

As stated above, under the existing market rules and Reg NMS regulations, the ability to submit orders at or below the best ask has a first order impact on order execution. Not being able to place orders at the best ask, could result in an important restriction on short selling activity, since sell orders placed above the best ask may take more time to execute or might not be executed at all.

The last test simulates the submission of short sale orders and computes the probability that an order would execute and the time to execution. Different bid increment levels were considered. The types of orders considered were limited, but the analysis still improves our understanding of the constraints imposed by a short sale price test.

Our analysis was based on historical trade and quote data. We acknowledge that if a short sale price test had been in place, the shape of the order book and the sequence of trades may be different than what we currently observe using historical trade and quote data. Nevertheless, we believe that our analysis was a good benchmark that can be used to assess the impact of a short sale price test.

Methods and Data

We used intraday quote and trade data from TAQ for six trading days during September 2008 (09/11/2008 through 09/18/2008). These days were characterized by high volatility; so, as a result, our analysis sheds light on the constraints imposed by a short sale price test in a high volatility environment.[1]

[1] We acknowledge that under different market conditions the statistics might change. For the period of the analysis volume was higher than average and spreads were larger than average. We think that this implies that, for example, executions rates were expected to be higher for our sample period compared to less volatile periods.

SEC_OEA_FCIC_001736

We calculated the "best ask price" and "best bid price" using data for Nasdaq, NYSE, NYSE Arca and ADF.[2] We used this information, together with last trade information, to generate an MSP. If the latest tick was an uptick, then the

- MSP was equal to the maximum of "best bid price + n cents", where "n" is the short sale price test increment from 1 to 5 cents, and "Last Trade Price".

If the latest tick was a downtick, then the

- MSP was equal to the maximum of "best bid price + n cents", where "n" is the short sale price test increment from 1 to 5 cents, and "Last Trade Price + 1 cent".

For our analysis we focused only on ordinary common stocks as classified by CRSP. We examined only NYSE, Amex and Nasdaq listed stocks and we excluded OTCBB or pink sheets stocks. We also eliminated any stock whose average quoted price on the day of the analysis was below $1.

To show how the price test affected different stocks, we grouped stocks by liquidity and price levels. We first classified stocks by the average number of shares traded in the month of July 2008. We used that variable to form five subgroups. Since the distribution of share volume of stocks is highly skewed, we chose to form smaller groups for highly traded stocks. Each of these subgroups were, in turn, divided into terciles according to the average price level on the trading day for a total of 15 different categories. The average price level equals the time weighted average of the midquote as calculated from the best ask and best bid.

The 6 day period ranging from September 11th to September 18th 2008 was characterized by large up and down market movements. In order to better understand how the short sale price test would affect the execution of short sales, we ran the analysis by looking at impact of such a rule under different market conditions. The impact of the rule is likely to depend on the market conditions that are associated with changes in bid ask spreads, volatility and the patience of market participants.[3]

We computed stock returns r_i for five minute intervals for each stock and we classify them into the following five categories:

1. $r_i < -100\ bp$
2. $-100\ bp < r_i < 0$
3. $r_i = 0$

[2]We have not included all market centers because we found instances in which stale or out of sequence quotes resulted in erroneous statistics. By considering a subset of market centers, we lowered the possibility that stale quotes might have resulted in incorrect calculation of midquotes and spreads. At the same time, we believe that the subset of markets considered is substantial and the analysis is not significantly affected by the exclusion of some market centers.

[3] The differentiated impact of the rule may have important policy implications. For example, in the analysis of the results of the Reg SHO pilot, one important hypothesis that proved to be unfounded is that an uptick test would dampen downward returns.

SEC_OEA_FCIC_001737

4. $0 < r_i < 100\ bp$
5. $r_i > 100\ bp$

where *bp* is basis points.

This classification will be used to report the results of our different measures of the level of restriction imposed by a short sale price test.

Results on Historical Data

a- MSP vs. price of short sales

In this subsection, we analyzed the fraction of short sale trades that would occur with a price below the MSP. A low proportion of trades occurring at prices below the MSP threshold would be an indication that the short sale price test would not be significantly restrictive. In other words, the rule would be unlikely to delay the execution of short sales if most of the short sales are executed at high enough prices already.

The computed statistics are shown on Table 1. Our findings indicate that the short sale price test would be more restrictive for highly liquid stocks and for lower-priced stocks. According to the computed statistics, for actively traded stocks, the fraction of short sales with price below MSP ranged between 99% (for 5 cent increment) and 61% (for 1 cent increment).

For less active stocks, the short sale price test rule would generally be less restrictive. Based on our analysis, the fraction of short sales with prices below MSP ranged between 59% (for 1 cent increment) and 83% (for 5 cents increment). When we considered the size of the increment relative to the size of the spread, the analysis suggested that the short sell price test was more restrictive for lower spread stocks. Moreover, short selling in low price stocks was prohibited more often than in high price stocks.

The data showed that a one cent increment would be restrictive for more than 60% of the short sales submitted. We also noticed that a five cents increment would be close to an outright ban on short selling for highly- and moderately-active stocks. In particular, for low-priced active stocks between 68% (one cent increment) to 99%(five cent increment) of short sales had a price below the MSP and thus, would not have executed at the same price.

In order to analyze the impact of the rule in down markets as opposed to up markets, we computed the fraction of short sale trades that occurred at prices below the MSP, based on contemporaneous five minute return categories. These results are presented in Table 2. To understand whether momentum type strategies were restricted more than contrarian strategies, we present the same data classified by the return in the previous five minute period. These results are presented in Table 3.

Table 2 indicates that the short sale price test would be more restrictive during extreme negative market returns than during extreme positive market returns. This was true across all groups of

SEC_OEA_FCIC_001738

stocks as the fraction of short sales with prices below MSP ranged between 76% and 69%. For the case of one cent bid increment in the group of the most liquid stocks with the lowest prices, the fraction of trades at prices below MSP is approximately 75% for periods of negative returns and between 63% and 56% for periods of positive returns. Short selling was less restricted for upward markets as the fraction of short sales with price below MSP ranged between 39% and 56%. We also noticed that for larger price increments, the differences in the percentage of restricted short sales did not appear to be monotonic. This is also true for one cent increments in many of the more active groups. The results seem more monotonic for the less active stocks than for the active stocks.

When comparing different groups of stocks, we found that a short sale price test would be more restrictive for highly traded stocks and for the group of stocks with low prices. When analyzing the difference in the fraction of restricted short sales between the extreme positive and extreme negative market movements we noticed a larger difference as we move from high to medium and low traded stocks.

The analysis for the five minutes lagged returns in Table 3 showed a reduced asymmetry of high versus low returns. The result suggests that the price test does not restrict momentum traders more than contrarian traders.[4]

Increasing bid increments results in significant variation in our measure. For highly traded stocks, under bid increment of 3 cents, around 90% of the short sales occurred at a price that was below the computed MSP and thus, the majority of short sales could not be executed by an incoming sell order.

In discussing the results we should again keep in mind that had the short sale price test actually been in place, the short seller submission strategies would most likely have been different.

b- MSP vs. Best Ask

In this part of the analysis, we examined the relationship of the MSP and the best ask spread. The purpose of this analysis was to understand whether the short sellers can place an order in the limit order book that is likely to be executed or can set a lower ask price. While the previous section focused on the price of executed short sales, here the focus is on the restrictions on order submission. The restriction will result from an interaction between already established Reg NMS rules on order protection and the hypothetical short sale price tests. The comparison between MSP and best ask price results in similar general conclusions to the analysis above. Our findings, in Table 4, indicate that the short sale price test would be more restrictive for more active stocks and for lower-priced stocks. For example, for highly traded stocks with a low price, the MSP was lower or equal to the best ask price with 1 cent increment 39% of the time while for the subgroup of stocks with low level of volume and low price level that number equaled 63%.

[4] Momentum traders purchase when the market rises and sell when the market falls in the previous trading session. Contrarian investors buy after a drop in the market and sell after a rise.

SEC_OEA_FCIC_001739

We also found that changes in the price test increment in the MSP formula would have a significant impact on how restrictive the short sale price would be. For example, for highly traded stocks with low prices, increasing the bid increment from 1 cent to 2 cents reduced the time that the MSP was lower or equal to the "best ask price" from 39% to 5% of the time. For the same group, a bid increment of 3 cents resulted in the MSP being lower or equal to the "best ask price" only 1% of the time.

We repeated the analysis on the relation between the MSP and the best ask spread above by looking at the five minute contemporaneous and lagged return. These second set of statistics are reported in Tables 5 and 6.

When we compared the MSP vs. Best Ask Price for different return levels, we observed an almost symmetric effect for the restriction on highly traded stocks. For this group, more volatile periods were associated with a lower level of restriction.

For stocks with medium and low levels of trading activity the results indicated that the rule would be more restrictive for negative market returns. Overall, the analysis showed that the rule would be more restrictive for highly liquid stocks. The results were confirmed for the five minutes lagged returns.

The analysis confirms that changes in the price test increment in the MSP formula would have a significant impact on how restrictive the short sale price test would be.

Simulation Results

In this section, the impact of a short sale price test was appraised by simulating the submission of short sale orders. In the previous analysis, we provided indirect calculations of the impact of the rule. We showed how the rule would constrain the ability to submit short sale orders. With the simulations, we computed the direct impact of the rule on short sale orders. We compute how the constraints imposed on order submission would have an effect on the probability of executing a short sale.

We simulated independent submission of small short sale orders to NYSE Arca. By independent, we mean that each order submitted was an unrelated event. We selected a small order size because it allowed for a more precise estimation of execution rates and time to execution. We have not considered sequence-connected orders because this would require modeling the dynamics of an order book. That is, we would have had to make assumptions about how the submission of one order would impact the ability to submit and execution rates of subsequent orders. Again, the assumptions made would have compromised the precision of the estimates.

Any interpretation of the results should take into account the fact that we simulated the type of order that exhibits the highest execution rate. Larger orders or a sequence of small orders would

be more negatively affected by a short sale price test, and thus, we would observe lower execution rates. Having this in mind, the statistics below should be viewed as a lower bound on the potential impact of the rule.

a. Outline of the algorithm:

For each stock we ran as many independent simulations as minutes during the trading day. At the beginning of each 60 second period, a new simulation was started. The input quote and trade data was the original information, unaffected by any simulation computed for a previous period. The order size was 100 shares.[5]

In our exercise, the order was priced at submission to satisfy the liquidity add plus uptick restriction described above for increments of one to three cents. TAQ data on quotes and trades was also used to calculate the initial price of the order and if, or when, the order was executed.

i- Order submission:

At the beginning of each one-minute period, the first step of the algorithm is to observe whether an order can be submitted at the best ask or better.[6]

An order was submitted at MSP (minimum shortable price) if that price was equal to or below the "best ask" at ARCA. If this was not the case, then the order was submitted at the MSP once MSP was equal or below the "best ask" at ARCA. No order was submitted if the MSP was always higher that the "best ask" at ARCA. In our statistics, this case counts as a period in which there was no trade execution.

We do not consider the submission of an order at a price that was higher than the "best ask". We were not able to observe depth levels at prices that were worse than the "best ask" which limits our ability to calculate when the order would be executed. This choice reduced the calculated rates of execution in our exercise.

ii- Order execution:

Once a simulated order was submitted, it was executed at the moment in which any of the following conditions were met:

- ARCA's "**best bid**" was **higher** than or equal to the price of the order.
- TAQ's trade file reported a **trade at a price higher** than the order's price.
- If the order was submitted below ARCA's "**best ask**" and TAQ's trade file reports, when a trade at ARCA at a price higher or equal to the order's price.

[5] This is smaller than the average size of a short sale for the period under analysis, which was approximately 250 shares. In addition, many times, traders split the original order into smaller orders send to different exchanges or at different times to improve price execution. This means that the average size of the original short sale order, was higher than the average size of the short sales as reported by the exchanges.

[6] We place a hypothetical order every minute, independently of the time of the day and stock characteristics.

- If the order was submitted at the **"best ask"** and ARCA's **"best ask"** did not change since the order was submitted, when "cumulative volume of trades reported by ARCA at the best ask since the order was submitted" was higher than the "size of ARCA's best ask at the moment of the order submission +100".
- If the order was submitted at the "best ask" and ARCA's "best ask" had increased since the order was submitted, when a trade reported by ARCA has a price equal or higher than the order's price.

iii- Order cancellation:

If a simulated order was not executed at the end of the one minute period, the order was canceled.

The simulations we computed cannot be easily compared to other studies that use historic order submission and execution. (See for example, Alexander, Gordon and Mark Peterson, "Implications of a Reduction in Tick Size on Short-Sell Order Execution", *Journal of Financial Intermediation* 11, 37-60 (2002) or Alexander, Gordon and Mark Peterson, "Short Selling in the New York Stock Exchange and the Effects of the Uptick Rule", *Journal of Financial Intermediation* 8, 90-116(1999).) In our exercise orders were submitted at a constant rate and only when the MSP allowed for submission at the best ask or better. In real markets, the submission of short sale orders occurs at different rates depending of market conditions. In addition orders might be canceled at high frequencies as changes in the order book dictate changes in the limit orders. In our exercise, orders were canceled only when the 60 second period had closed.

Another reason why a comparison with the above mentioned work by Alexander and Peterson is difficult is that the markets have greatly changed since the period analyzed by those studies. Among other characteristics, these changes include fragmentation, significantly thinner bid-ask spreads and higher speed of execution, submission and cancellation of orders.

b. Results

The simulations showed that bid increments, stock characteristics and market conditions had a significant influence on the execution statistics. Higher bid increments reduced the rate of execution and increased the time to execution in a very significant way. Execution statistics were notably more affected for lower priced stocks. Periods of high volatility (five minute periods with positive returns above 1% or negative returns below -1%) showed higher execution rates. Finally, for a given absolute level of returns, execution rates were higher for periods of positive returns than for periods of negative returns.

Table 7 shows summary statistics on this simulation for a sample of 18 stocks. The sample consisted of 9 stocks of the highly traded group, as classified in the previous section and 9 stocks of the group with medium trading activity. For each of these groups, 3 stocks belonged to each of the price categories as detailed in the previous section (high, medium and low price).

The table presents simulations of short sale order submission under the rule for 1, 2 and 3 cents increments. In addition to that, we report statistics for a simulation in which the only restriction is that at the time of submission, the order cannot interact with displayed liquidity. The order was submitted at a price equal to "Best Bid +1 cent" and these simulations are reported under the label "Liquidity Provider."

The first two columns of the table contain information describing the subgroup of stocks to which the data corresponds. The number of simulations for each return level is reported in the fourth column.

For the simulation group, execution rates and time to execution were reported. The time to execution column calculates, for executed orders, the difference between the time in seconds at which the order was executed and the start of the one minute period of each simulation. Note that since we assume that orders were submitted only once and the MSP was equal or below the best ask, this is not time to execution since the order was submitted but rather time to execution since the simulation period started.

Not surprisingly, active stocks were associated with higher execution rates and lower time to execution. The table shows that this holds for all market conditions and price level of stocks.

Bid increments had a significant impact on the statistics. For example, for a "3 cents bid increment" during periods with moderate volatility (between -1% and 1% five minute return) execution rates were remarkably low. For highly traded low price stocks, execution rates for moderate volatility periods are below 20%. For those 20% executed orders, the average time to execution was approximately 28 seconds. This indicates not only that few orders were executed but also that the average time to execution of the simulated orders was significantly increased with an increase in the number of bid increments.

We observed that execution rates were higher for stocks with a high price. For one cent increments, execution rates were near 90% for stocks with high prices. For low price stocks, that number was below 70% if we excluded periods with high return levels (higher than 1% five minute return). This difference was more noticeable for higher bid increments. For three bid increments and with moderate volatility (between -1% and 1% five minute return) the execution rates were approximately 20% for lower priced stocks and 60% for higher priced stocks.

The analysis of periods characterized by different return levels showed that market conditions had a visible influence on execution statistics. Periods of low volatility (five minute periods with positive returns below 1% or negative returns above -1%) showed lower execution rates and lower time to execution. This difference was more evident for lower priced stocks and higher bid increments.

While volatility resulted in higher execution rates, we observed that the effect was not symmetric. For a given level in absolute returns, five minute periods with positive returns exhibited execution rates that were higher than in periods of negative returns. For example, with a bid increment of 3 cents and for highly traded lower priced stocks, a period of returns below -1% had 33% execution rates while for five minute periods with returns above 1% the execution

rates were 56%. This asymmetry holds for all groups of stocks but was more evident for lower priced stocks.

We also run simulations for a subset of stocks corresponding to leading financial institutions. This selection was made with the objective of analyzing the restriction imposed by a short sale price test on stocks of great relevance during the period of the study. The statistics for these stocks were consistent with what we have detailed above for the sample of 18 stocks.

Appendix

Table 1 - Minimum Shortable Price(MSP) vs. Actual Short Sale Price (9/11/2008-9/18/2008)

This table summarizes the percentage of short sales with price below the Minimum Shortable Price (MSP) for different price increments for the dates between September 11th and September 18th 2008.. If the latest tick was an uptick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price". If the latest tick was a downtick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price + 1cent". We focused only on ordinary common stocks and we excluded stocks whose price on the day of the analysis was below $1. We grouped stocks by liquidity and price levels. We first classified stocks in five groups by the average number of shares traded in the month of July 2008. Each of these subgroups were then divided into terciles according to the average price level on the trading day. The average price level equaled the time weighted average of the midquote. Best Bid and Offer calculated from Daily TAQ data corresponding to ADF, NASDAQ, NYSE and NYSE Arca. Share Volume Information corresponded to daily averages for July 2008.

Share Volume Group	Price Group	# Obs	% of Short Sales w/price below MSP (for different increment levels)					Average Bid Ask Spread	Average Price

Table 2 - Minimum Shortable Price(MSP) vs. Actual Short Sale Price (9/11/2008-9/18/2008) contemporaneous returns

This table summarizes the percentage of short sales with price below the Minimum Shortable Price (MSP) for different price increments and for different levels of contemporaneous returns, for the dates between September 11th and September 18th 2008. If the latest tick was an uptick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price". If the latest tick was a downtick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price + 1cent". We compute stock returns ri on a five minute intervals for each stocks and we classify them into the following five categories: 1) ri < -100 bp; 2) -100 bp < ri <0; ri =0; 0< ri <100 bp; ri>100 bp. We focus only on ordinary common stocks and we exclude stocks whose price on the day of the analysis was below $1. We grouped stocks by liquidity and price levels. We first classified stocks in five groups by the average number of shares traded in the month of July 2008. Each of these subgroups were then divided into terciles according to the average price level on the trading day. The average price level equaled the time weighted average of the midquote. Best Bid and Offer calculated from Daily TAQ data corresponding to ADF, NASDAQ, NYSE and NYSE Arca. Share Volume Information corresponded to daily averages for July 2008.

Table 4 - Minimum Shortable Price(MSP) vs. Best Ask Price (9/11/2008-9/18/2008)

This table summarizes the percentage of time the Minimum Shortable Price (MSP) was equal to the best ask price (Panel I) and lower than the best ask price(Panel II) for different price increments, for the dates between September 11th and September 18th 2008. If the latest tick was an uptick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price". If the latest tick was a downtick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price + 1cent". We focused only on ordinary common stocks and we excluded stocks whose price on the day of the analysis was below $1. We grouped stocks by liquidity and price levels. We first classified stocks in five groups by the average number of shares traded in the month of July 2008. Each of these subgroups were then divided into terciles according to the average price level on the trading day. The average price level equaled the time weighted average of the midquote. Best Bid and Offer calculated from Daily TAQ data corresponding to ADF, NASDAQ, NYSE and NYSE Arca. Share Volume Information corresponded to daily averages for July 2008.

Table 5 Minimum Shortable Price(MSP) vs. Best Ask Price (9/11/2008-9/18/2008) contemporaneous returns

This table summarizes the percentage of time the Minimum Shortable Price (MSP) was equal to, lower than, or higher than the best ask price for different price increments and for different levels of contemporaneous returns, for the dates between September 11th and September 18th 2008. If the latest tick was an uptick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price". If the latest tick was a downtick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price + 1cent". We computed stock returns, r_i in five minute intervals for each stocks and we classified them into the following five categories: 1) $r_i < -100$ bp; 2) -100 bp $< r_i < 0$;3) $r_i = 0$; 4) $0 < r_i < 100$ bp; 5) $r_i > 100$ bp. We focused only on ordinary common stocks and we excluded stocks whose price on the day of the analysis was below $1. We grouped stocks by liquidity and price levels. We first classified stocks in five groups by the average number of shares traded in the month of July 2008. Each of these subgroups were then divided into terciles according to the average price level on the trading day. The average price level equaled the time weighted average of the midquote. Best Bid and Offer calculated from Daily TAQ data corresponding to ADF, NASDAQ, NYSE and NYSE Arca. Share Volume Information corresponded to daily averages for July 2008.

Table 6 Minimum Shortable Price(MSP) vs. Best Ask Price (9/11/2008-9/18/2008) lagged returns

This table summarizes the percentage of time the Minimum Shortable Price (MSP) was equal to, lower than, or higher than the best ask price for different price increments and for different levels of contemporaneous returns, for the dates between September 11th and September 18th 2008. If the latest tick was an uptick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price". If the latest tick was a downtick, MSP was equal to the maximum of "best bid + n cents" and "Last Trade Price + 1cent". We computed stock returns, r_i, in five minute intervals for each stocks and we classified them into the following five categories: 1) $r_i < -100$ bp; 2) $-100 \text{ bp} < r_i < 0$;3) $r_i = 0$; 4) $0 < r_i < 100$ bp; 5) $r_i > 100$ bp. We focused only on ordinary common stocks and we excluded stocks whose price on the day of the analysis was below $1. We grouped stocks by liquidity and price levels. We first classified stocks in five groups by average number of shares traded in the month of July 2008. Each of these subgroups were then divided into terciles according to the average price level on the trading day. The average price level equaled the time weighted average of the midquote. Best Bid and Offer calculated from Daily TAQ data corresponding to ADF, NASDAQ, NYSE and NYSE Arca. Share Volume Information corresponded to daily averages for July 2008.

Table 7-A
Stocks: Three sampled stocks from each subgroup of stocks
Period: 09/12/2008-09/18/2008

This table summarizes the probability that an order would execute and the time to execution when we simulated the submission of a short sell order for a group of 9 stocks of the highly traded group (>7ml shares). The price and the volume categories for the stocks are as described in the main text of the memo. For each of these groups, 3 stocks belonged to each of the price categories (high, medium and low price). We used the Daily TAQ's trade and quote reports for ARCA to simulate the market condition.
exec= percentage of the simulation which a short sale is executed.
sec = time to execution in seconds (for simulations that result in an execution).

Table 7-B
Stocks: Three sampled stocks from each subgroup of stocks
Period: 09/12/2008-09/18/2008
This table summarizes the probability that an order would execute and the time to execution when we simulated the submission of a short sell order for a group of 9 stocks of the medium traded group (more than .6m less than2.3m shares). The price and the volume categories for the stocks are as described in the main text of the memo. For each of these groups, 3 stocks belonged to each of the price categories (high, medium and low price). We used the Daily TAQ's trade and quote reports for ARCA to simulate the market condition.
exec= percentage of the simulation which a short sale is executed.
sec = time to execution in seconds (for simulations that result in an execution).
